

Provide a better worker safety experience.

Engage users to make safe decisions, or automate safety by leveraging hyper-local context with Jamf.

Success starts with safety.

With more businesses than ever moving employees to remote work and bringing analog workflows online, worker safety as a whole is becoming a more complex topic. From construction sites to entirely remote businesses or schools, device utilization in a wide range of environments adds a number of safety, deployment and security variables.

Now, with Jamf, you can empower your employees to take an active part in the safety experience of their mobile technology, and automate business-critical policies to save them added stress allowing them to simply get work done.

1 IN 5

fatally injured workers in 2019 was a mobile sales worker or truck driver

NEARLY 40%

of workplace-related fatalities in 2019 involved transportation incidents

1 IN 5

employee deaths in 2019 were in the construction industry

Make worker safety simple and seamless.

Standardization:

Create a device experience with the employee in mind, whether being used by one or many. Set the wallpaper with a company logo, define the Home Screen layout in a way that makes sense, and hide unwanted system apps that are not needed for employees' productivity.

Managed Lost Mode:

If an iPhone or iPad gets lost, put the device in Lost Mode and Low Power Mode to find the device and manage battery life. In just a few clicks, the admin will know the location of the device and have the peace of mind that company data is safe and secure.

Data usage management:

Jamf helps admins ensure the right apps connect to the right network. Easily restrict changes to personal hotspots, use APN configuration to assign devices to cellular network and enforce Wi-Fi "on or off." When using iPad, simplify carrier connectivity for eSIM deployment with Jamf.

Privacy protection:

Keep your devices secure and maintain the trust and privacy of employees. Mobile device management will not read iMessages, emails or listen to phone calls. It cannot access device photos or videos, and will not report browsing or app usage habits.

User-initiated safety:

Encourage the right behavior by inviting employees to enforce workplace safety. This will help build habits in employees to actively keep themselves safe. Use Jamf Setup and Jamf Reset to manage the configuration of the device so the right app is in the right place at the right time.

Automated safety:

Jamf makes the automation of worker safety easier through partnership with leading worker safety solutions, including TRUCE Software. Jamf's MDM and ecosystem management capabilities partnered with industry-specific solutions work together to equip you with the best automations and workflows to keep your organization and employees safe.

Safety first. Safety always.

Get ready to:

- Protect employees while they use mobile devices, no matter where they are
- Reduce business costs related to insurance premiums and settlements
- Create a delightful user experience while enforcing company safety policies
