Anywhere Work is our new reality

Remote work and cloud computing define the modern workplace

4x

Remote work has quadrupled over the last decade

70%

of workers do not sit behind a desk

85%

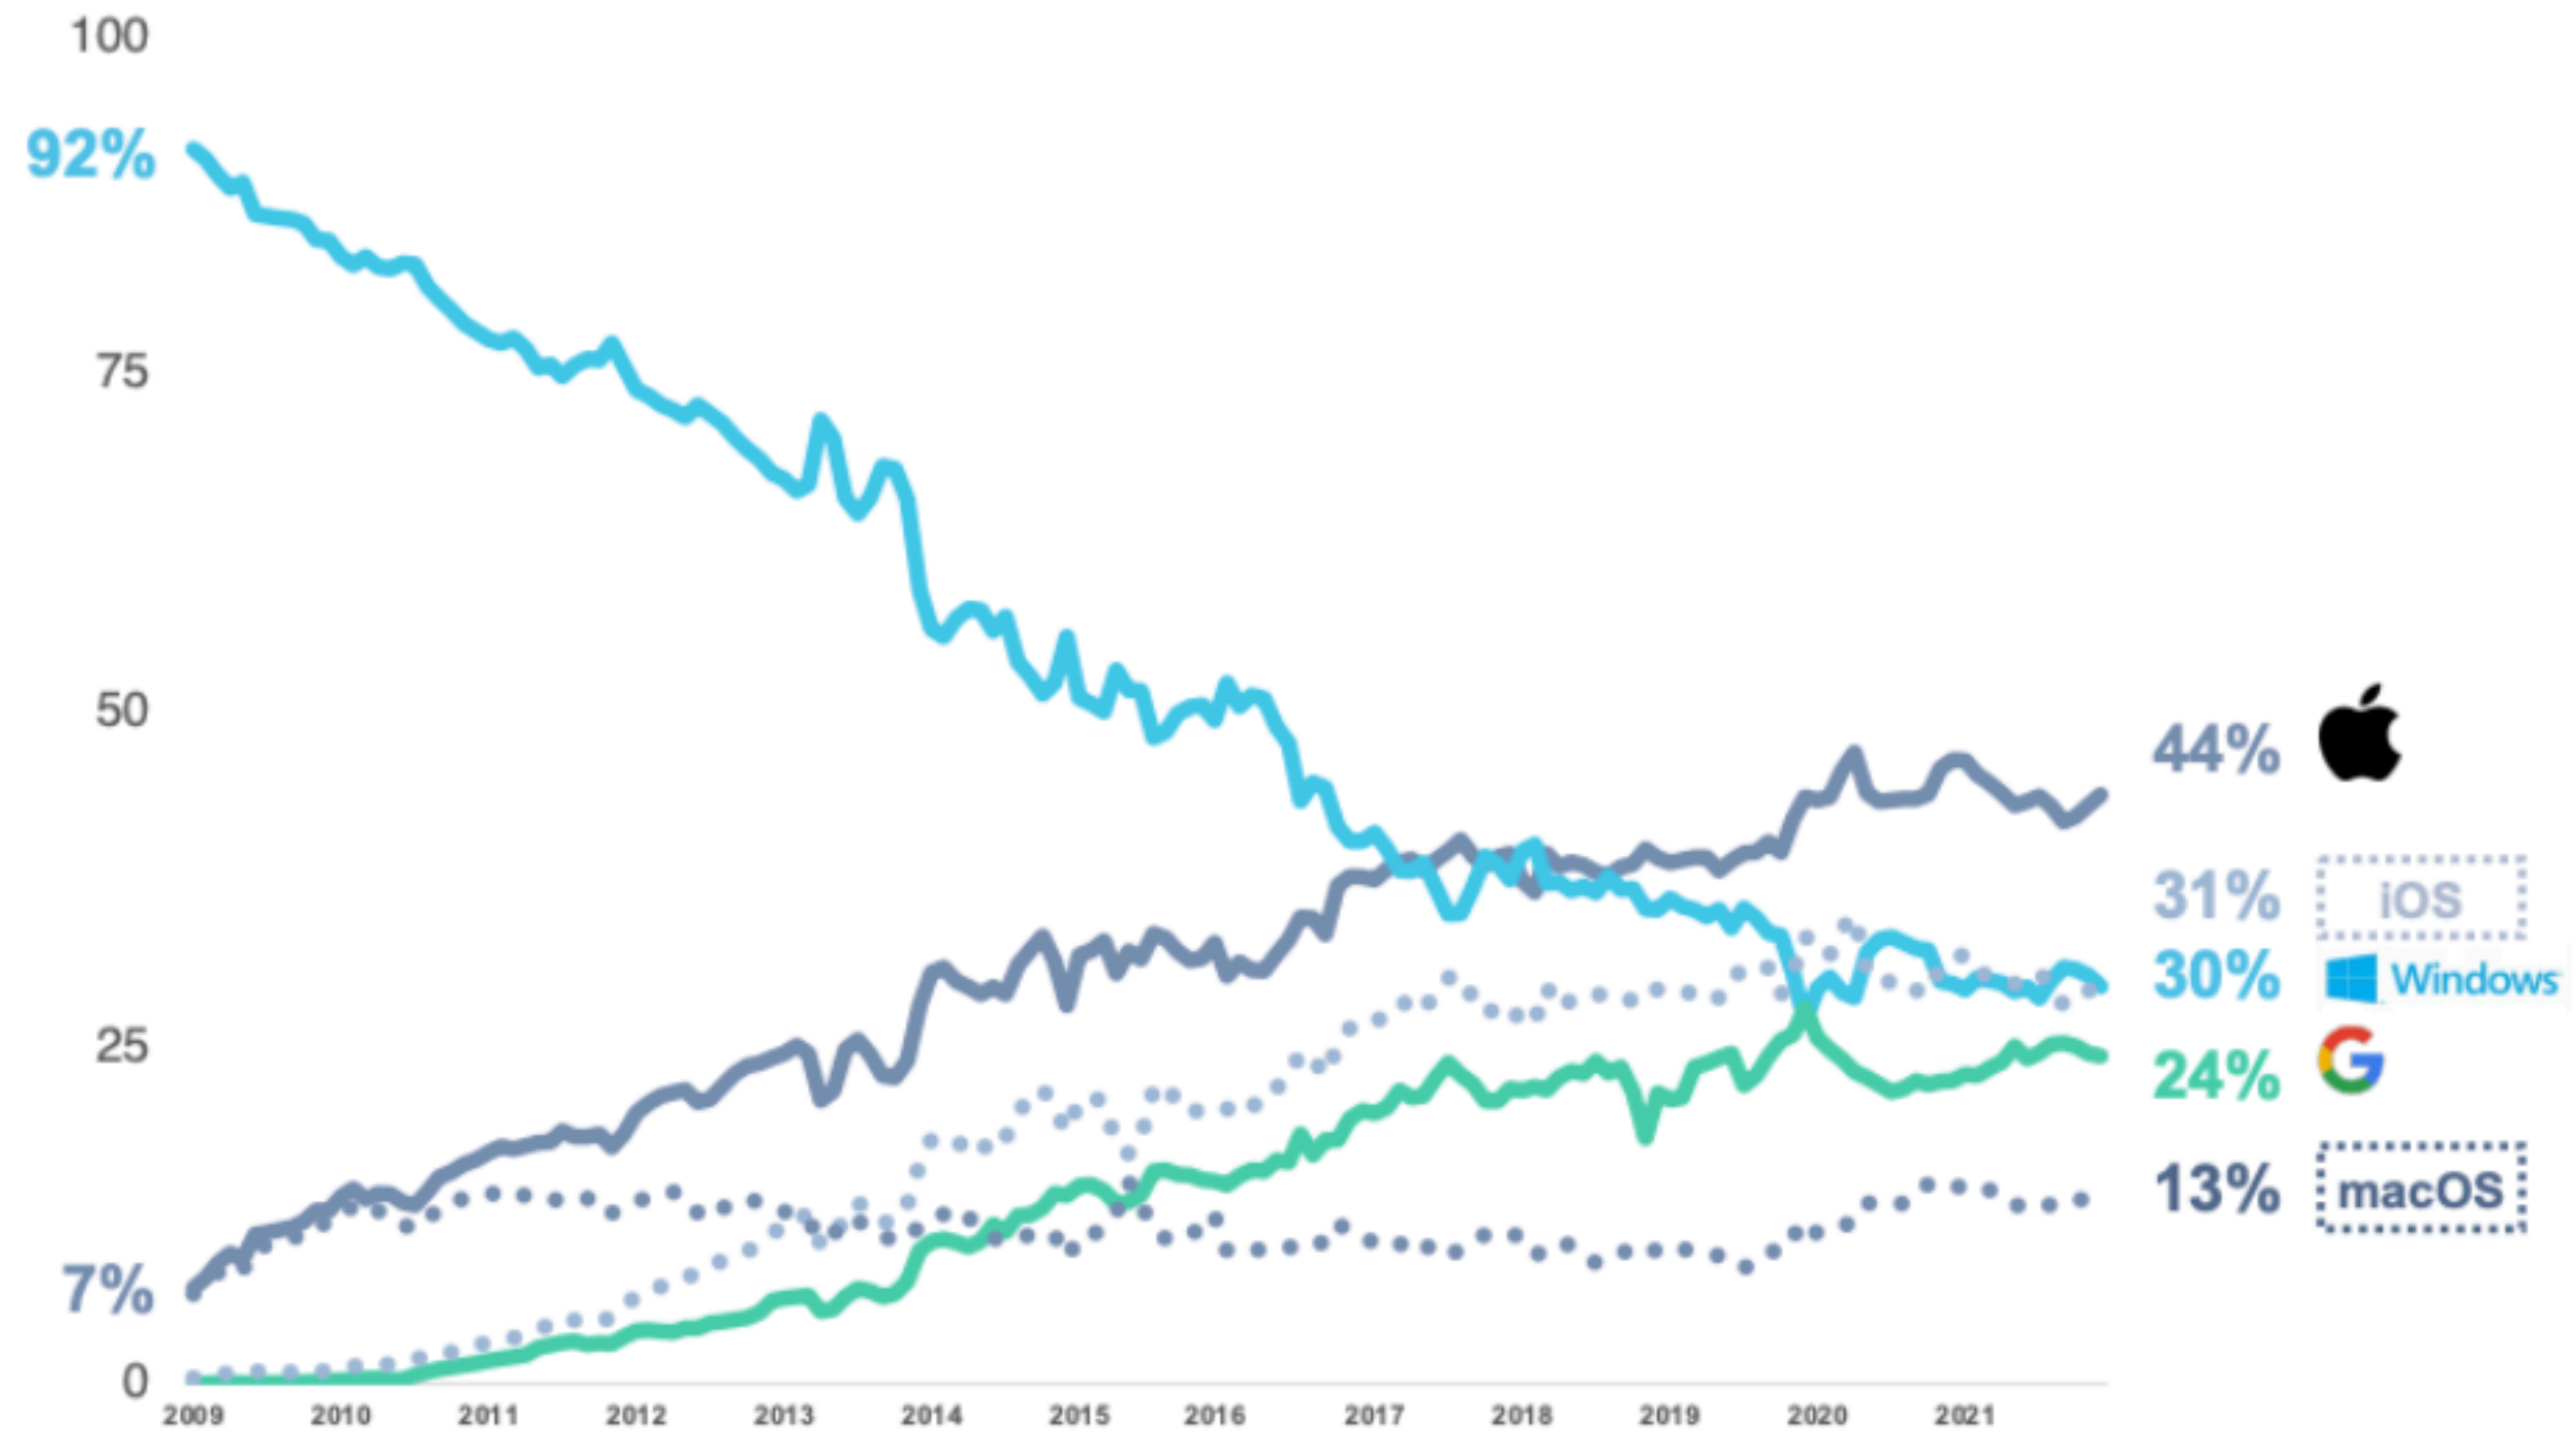

of workloads are now in the cloud

89%

of users willing to make salary sacrifice for device choice

A market shift is underway

Modern Platforms bring Modern Risks

Frameworks are needed for managing and securing your devices

Insecure configurations

Sophisticated and targeted attacks

User-initiated risk

User devices are a gateway to Business Applications

61%

of workers have allowed friends or family to use their work devices

28%

of corporate devices are running a **vulnerable OS**

37%

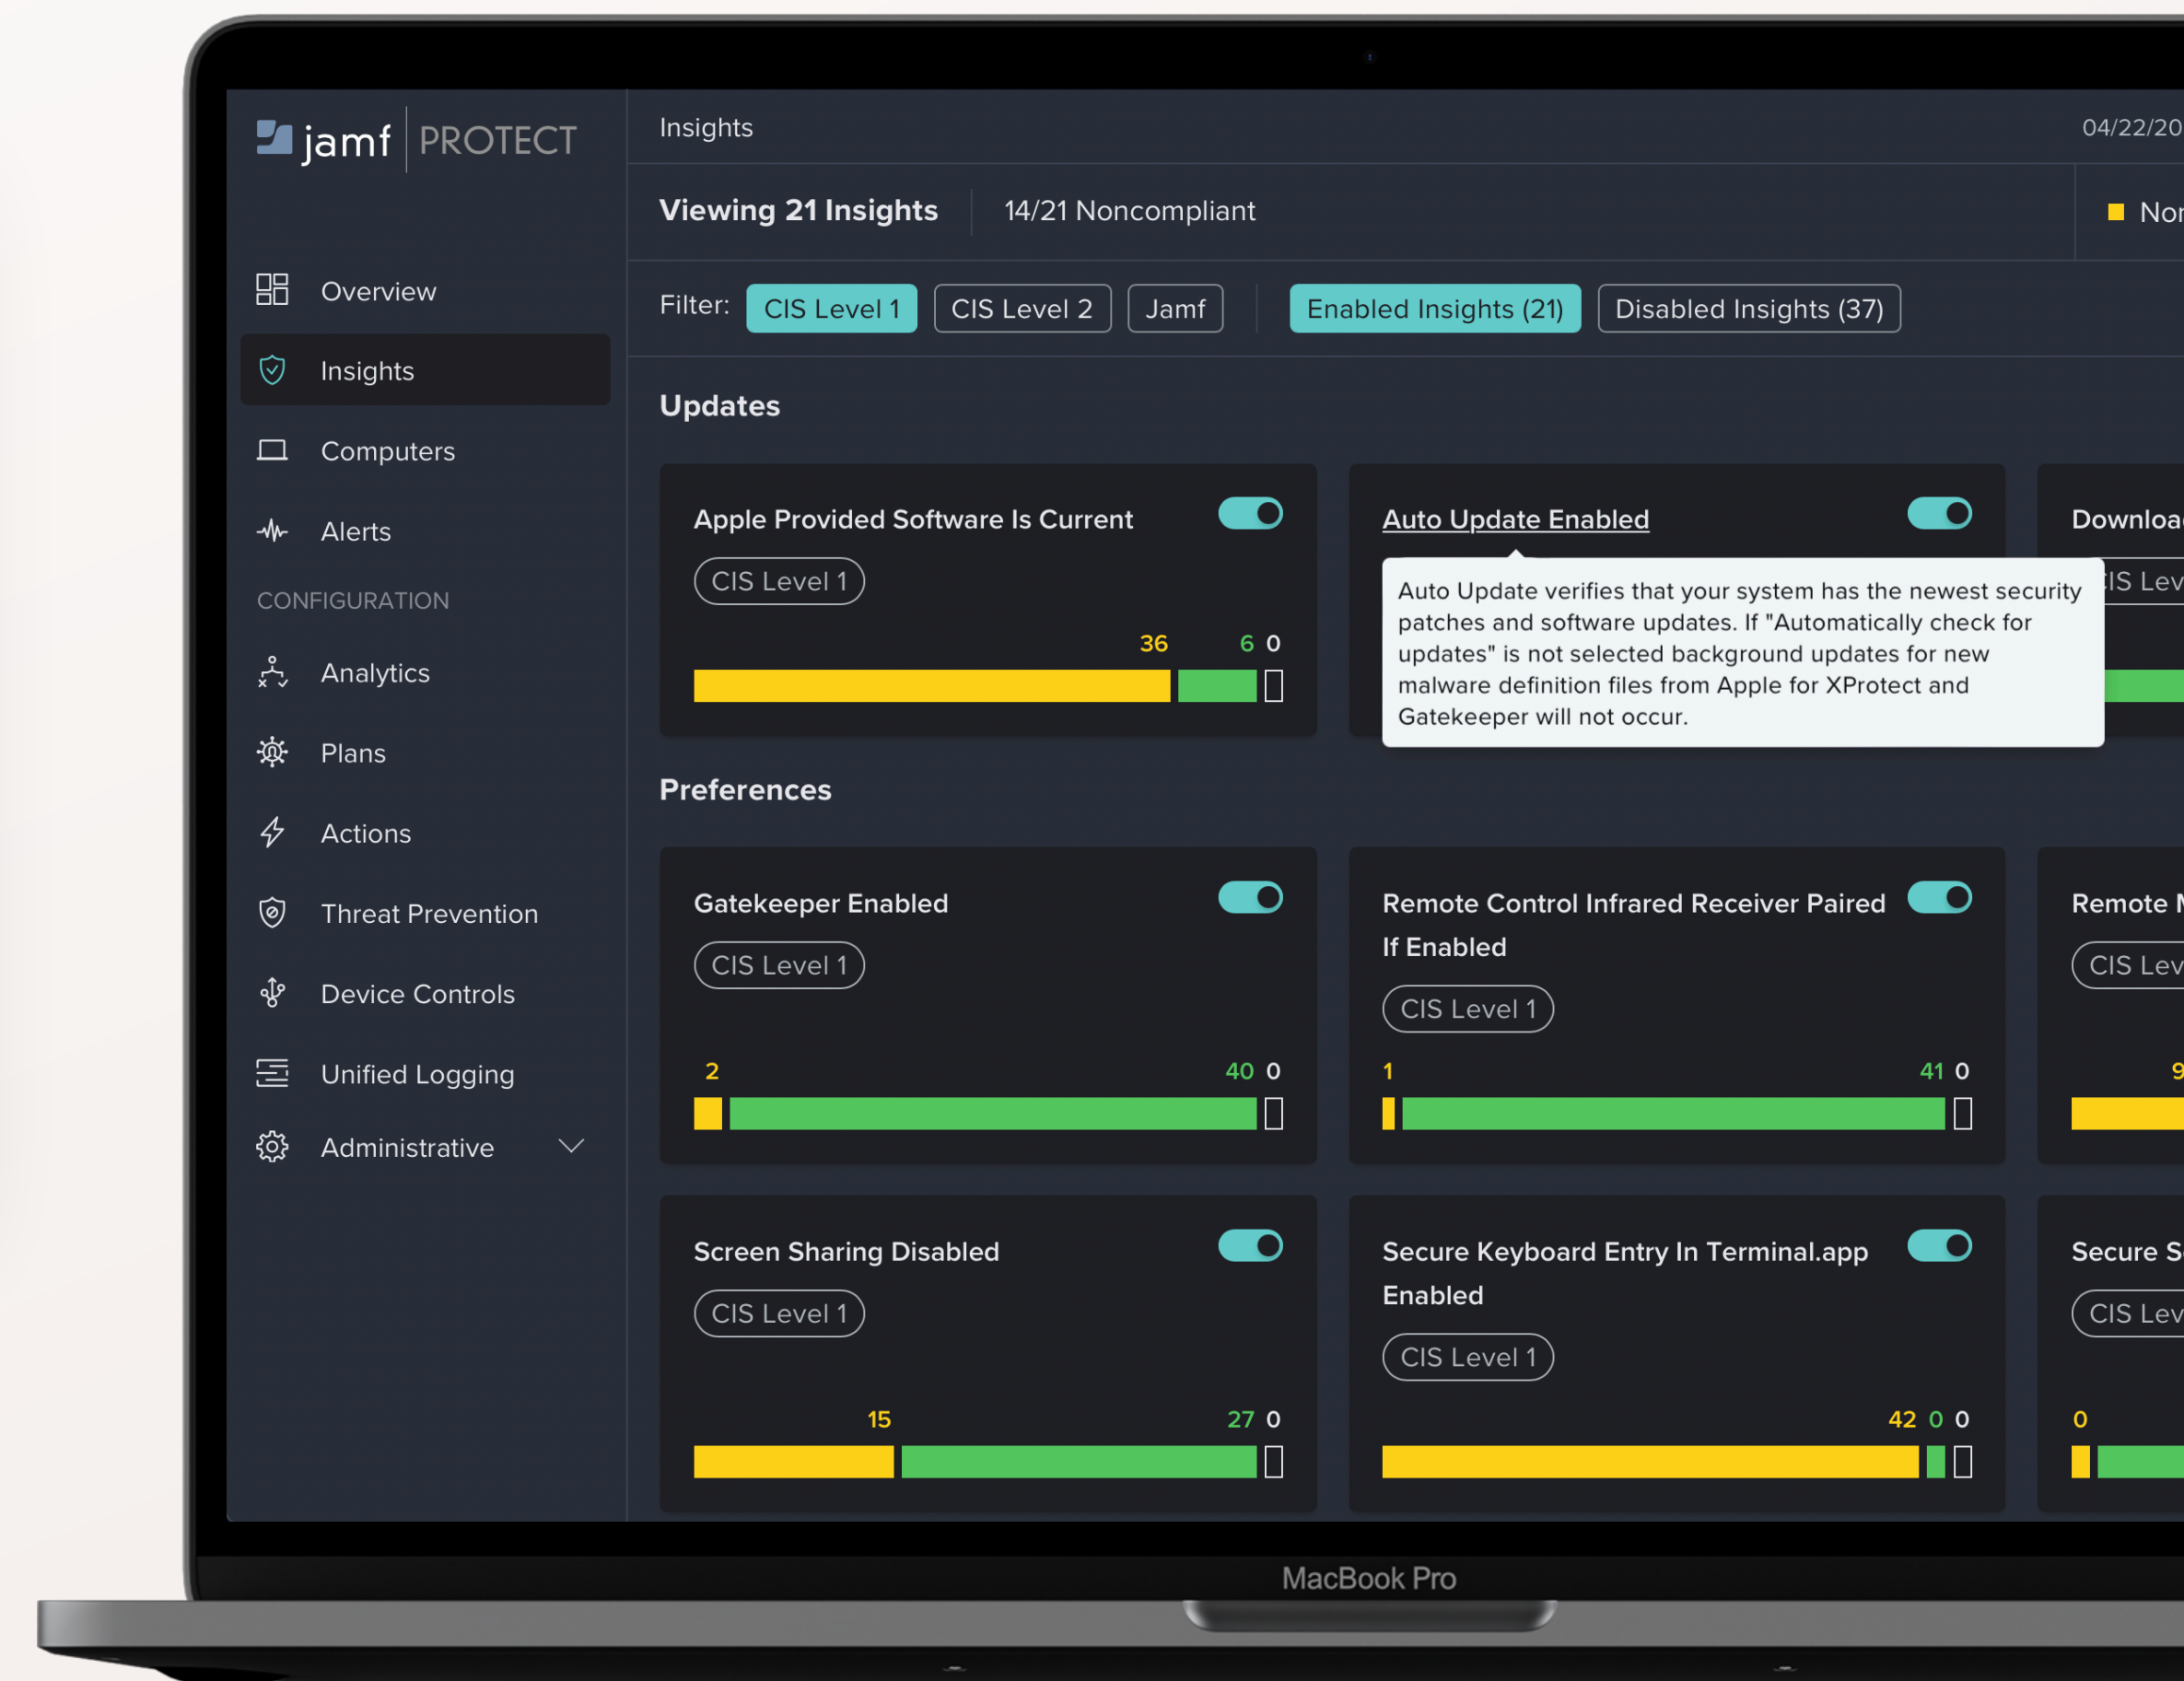

Only 37% of companies reported using whole-disk encryption on laptops

Survey results from the 2021 Verizon Mobile Security Index

● **JAMF NATION LIVE**

Secure configurations are becoming essential for doing business

- **General disruption to business operations**
 - Ransomware
 - Denial of Service
- **Regulatory pressure and regional mandates**
 - Sarbanes-Oxley
 - Health Insurance Portability and Accountability Act (HIPAA)
 - General Data Protection Regulation (GDPR)
 - Executive Order to Improve US Cybersecurity
- **Cybersecurity Best Practices**
 - Center for Internet Security (CIS) Benchmarks

Hackers have an increased surface area available to attack

Establishing secure baselines is just the start
Active protections are essential to ensure users and devices remain secure

Apple devices are increasingly targeted

Increasing market share and security perceptions make these platforms a target

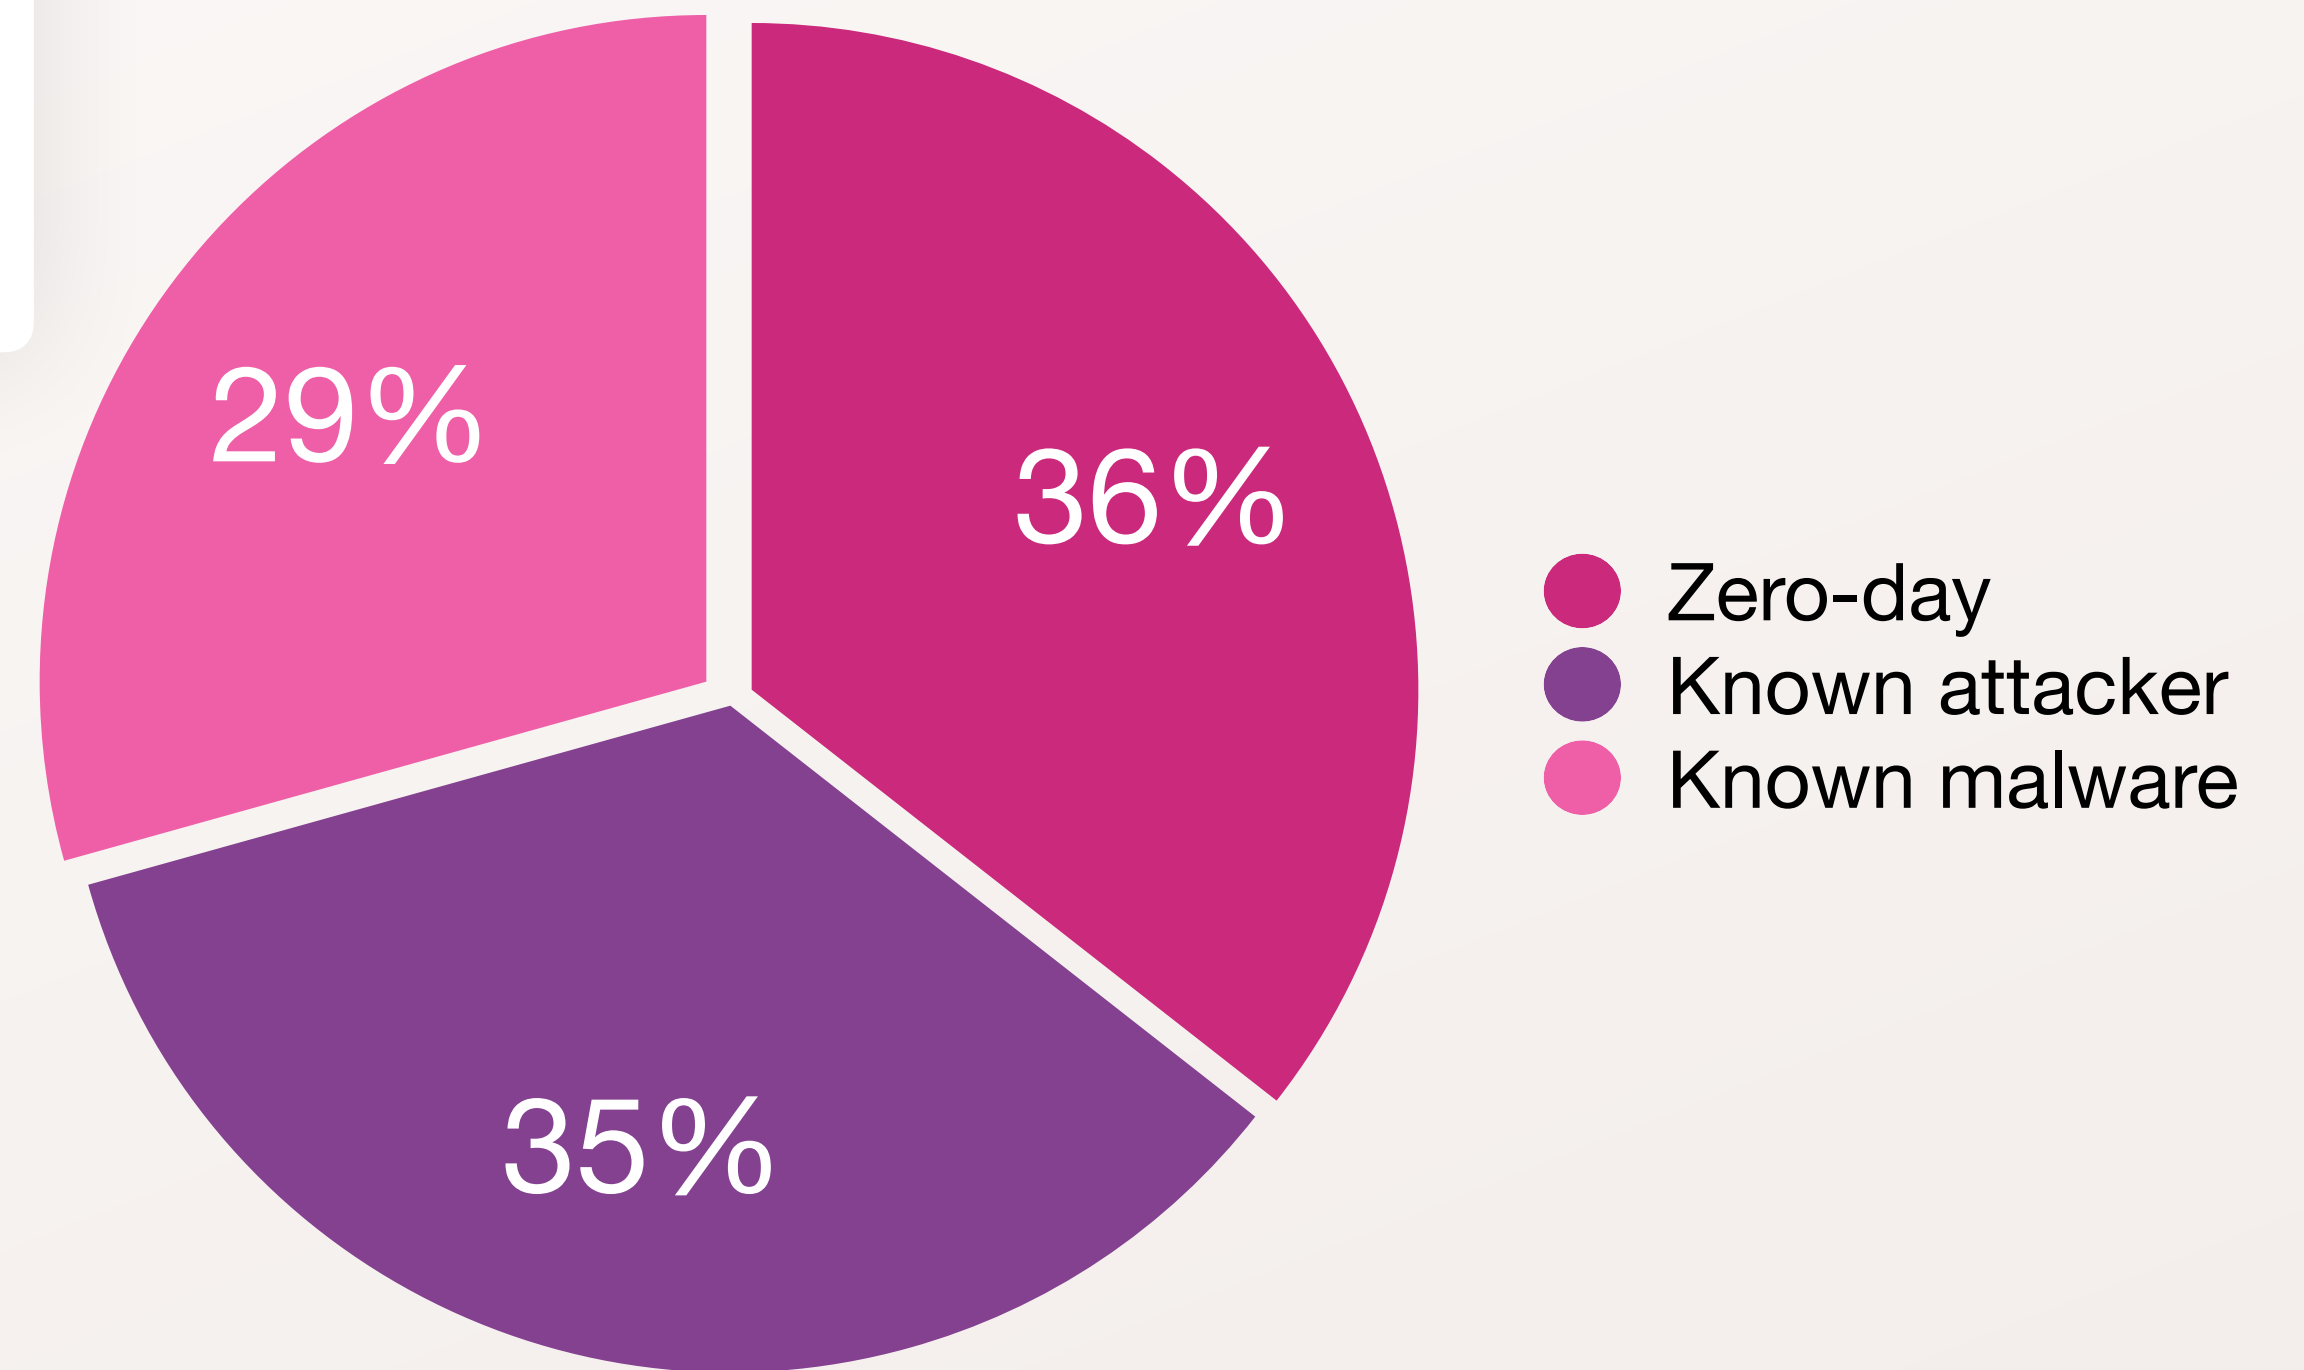

A recent analysis of malware from production environments found that macOS-focused attacks were diverse and increasing.

Apple devices are increasingly targeted

Increasing market share and security perceptions make these platforms a target

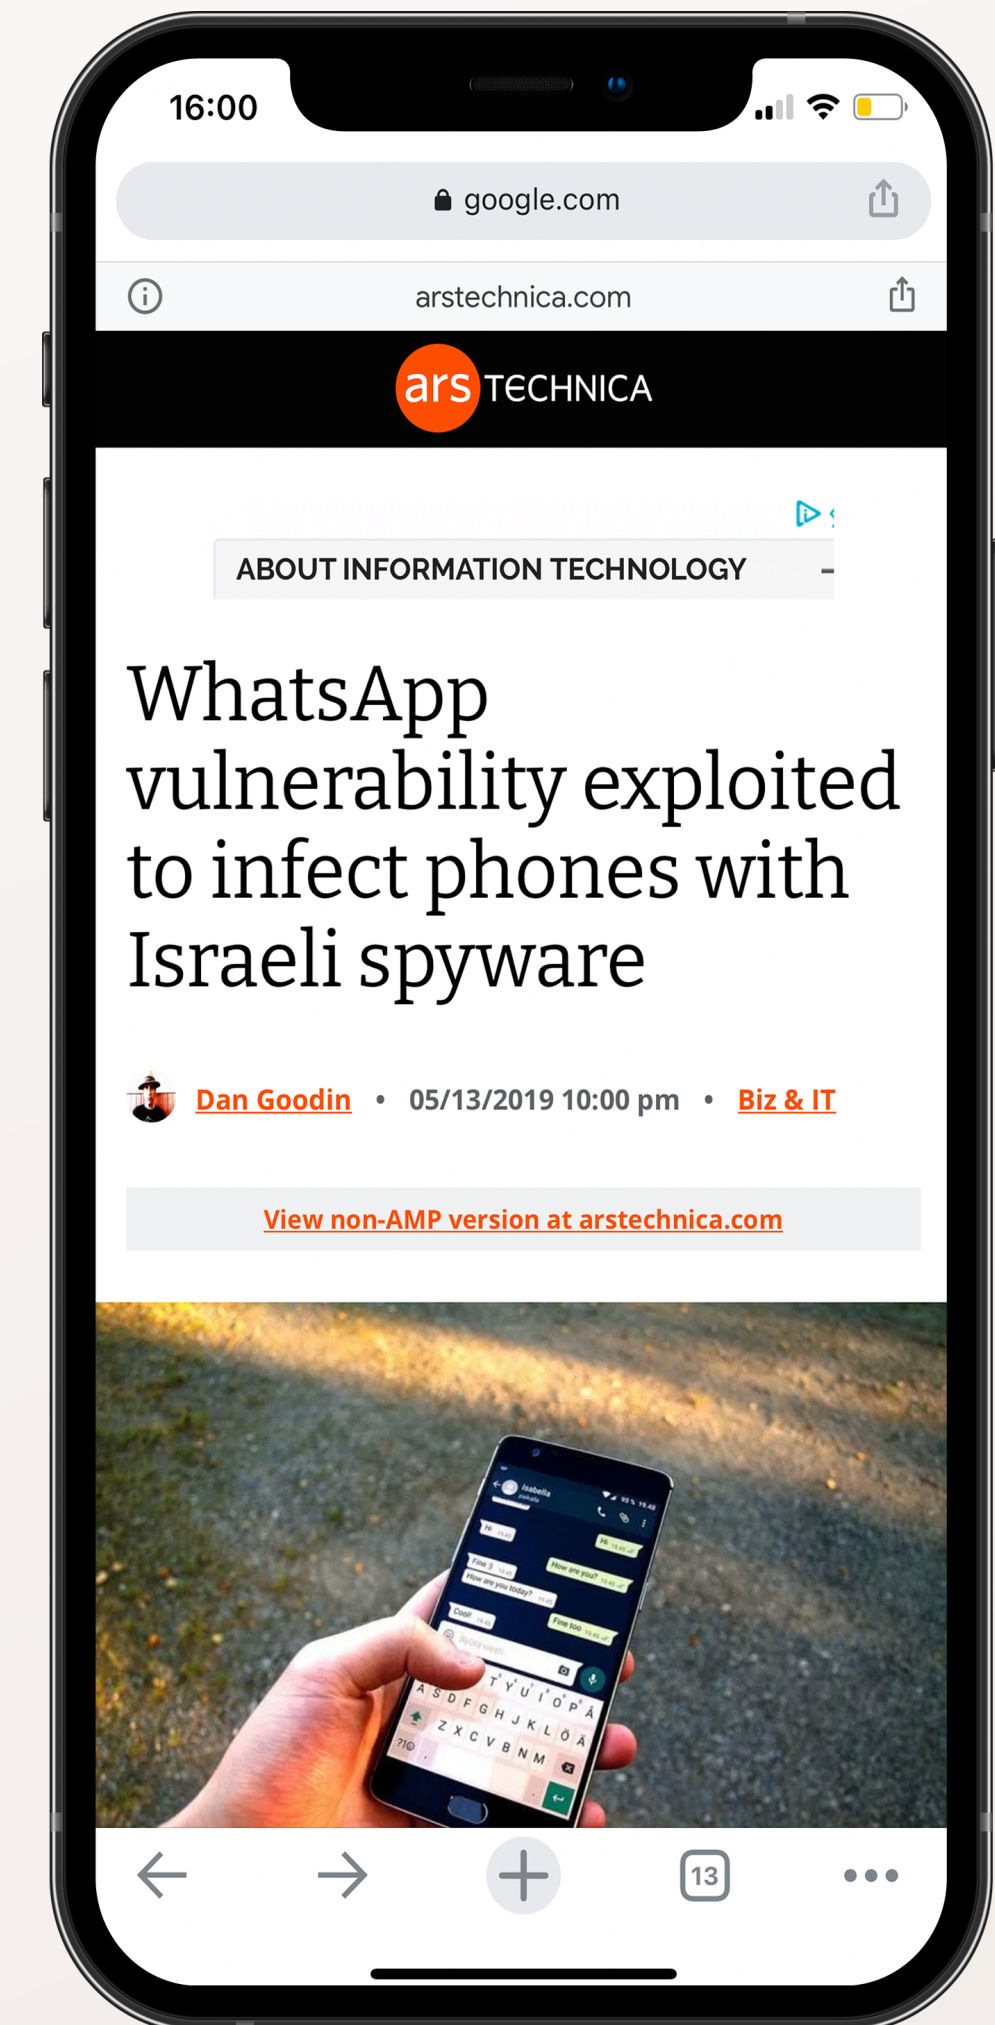

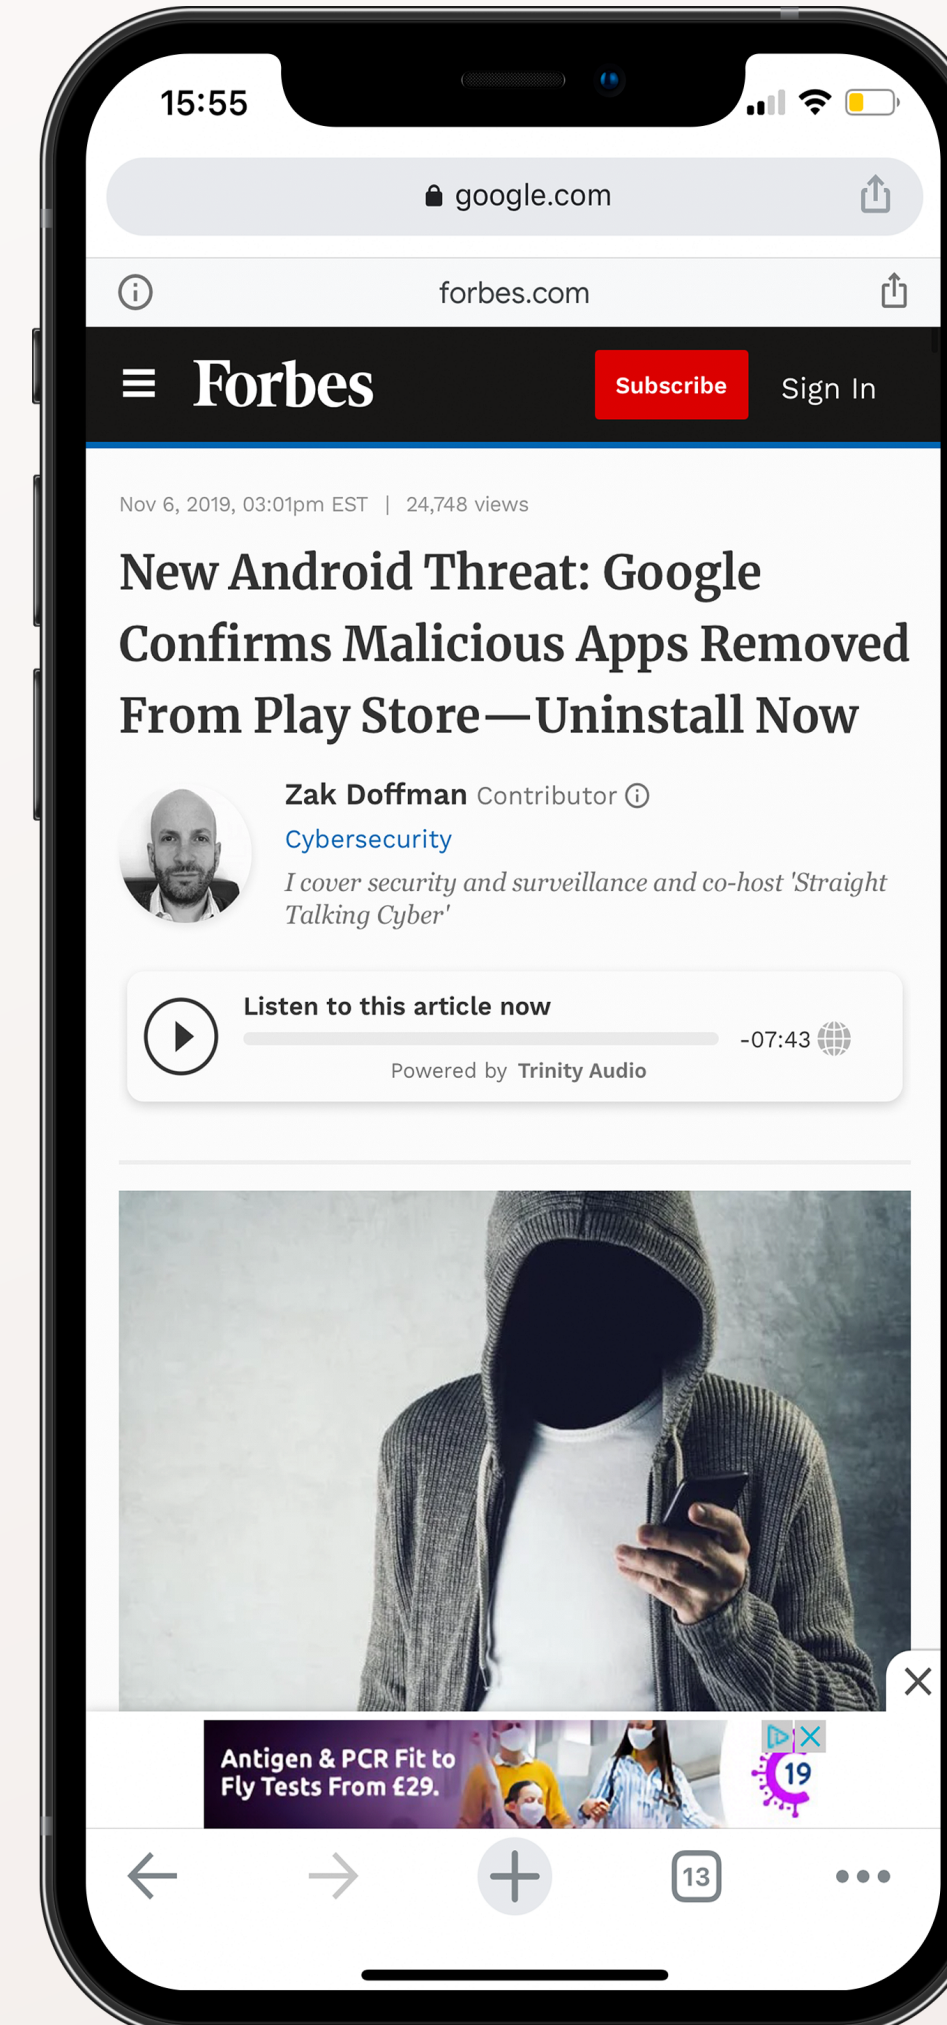

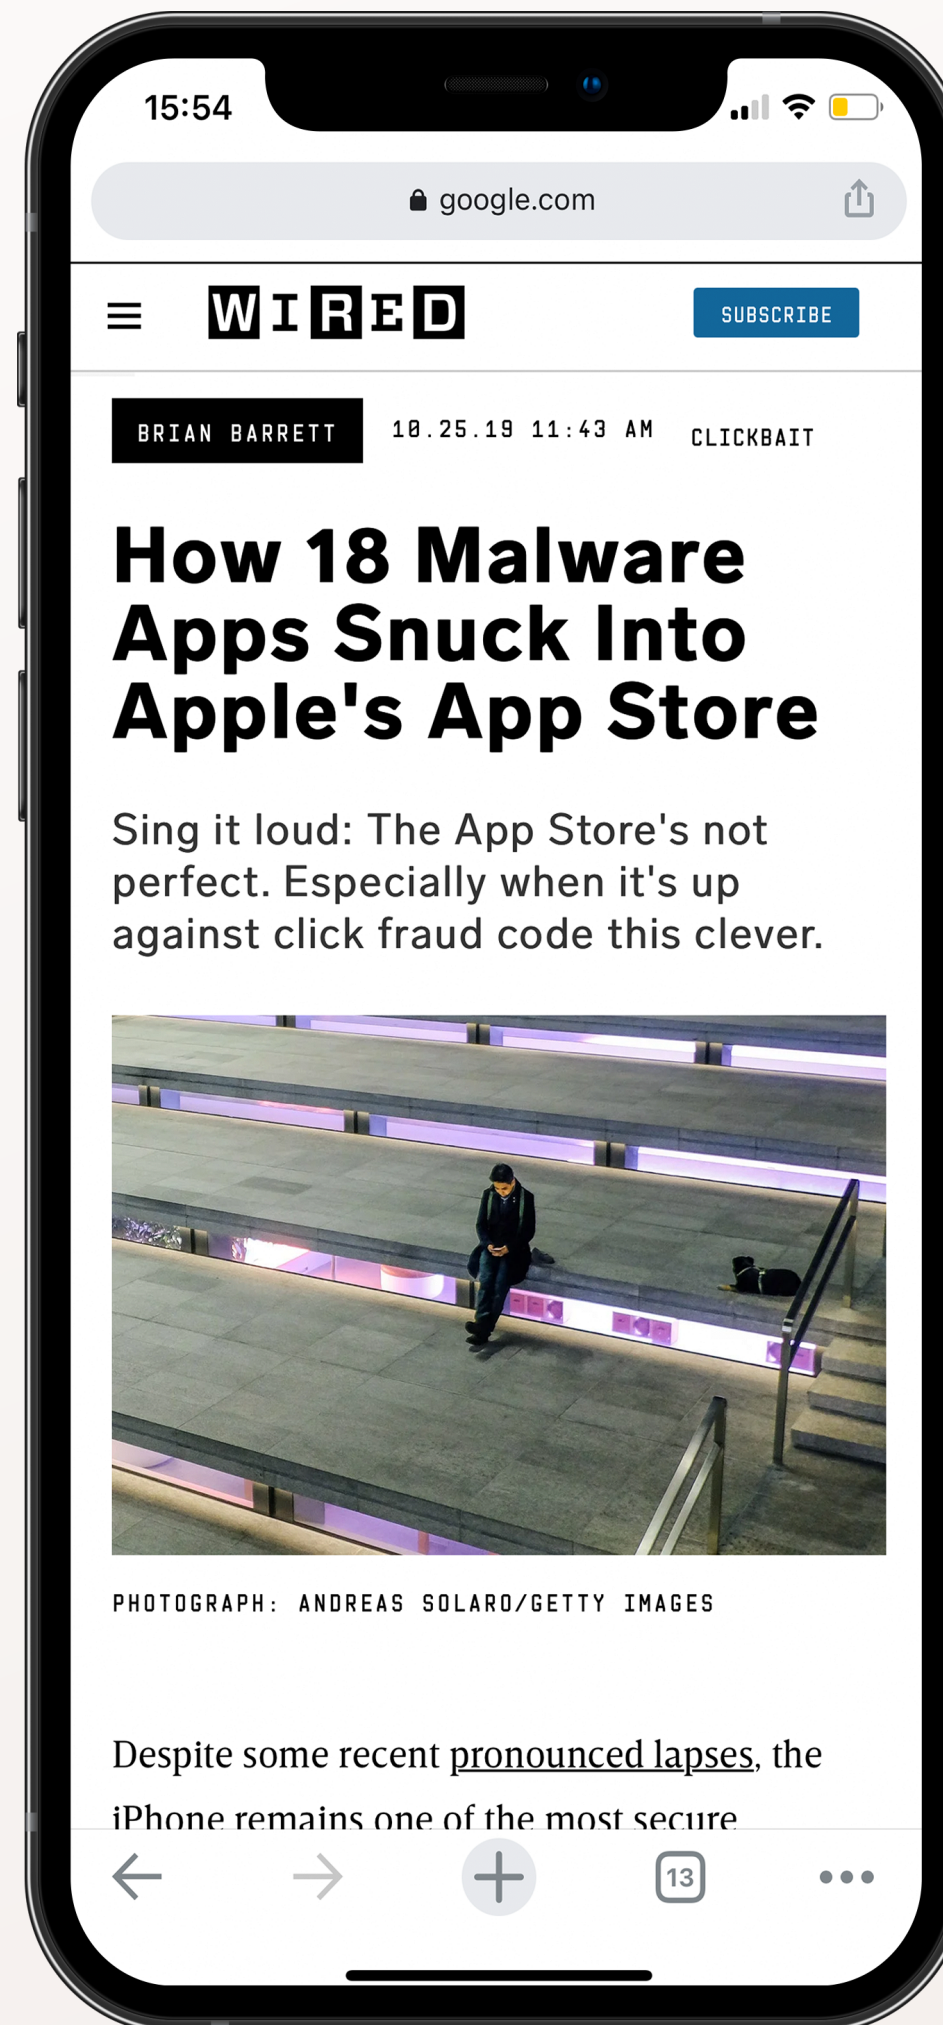

Only one-third of malware samples extracted from customer environments were previously-known

Mobile is not risk-free

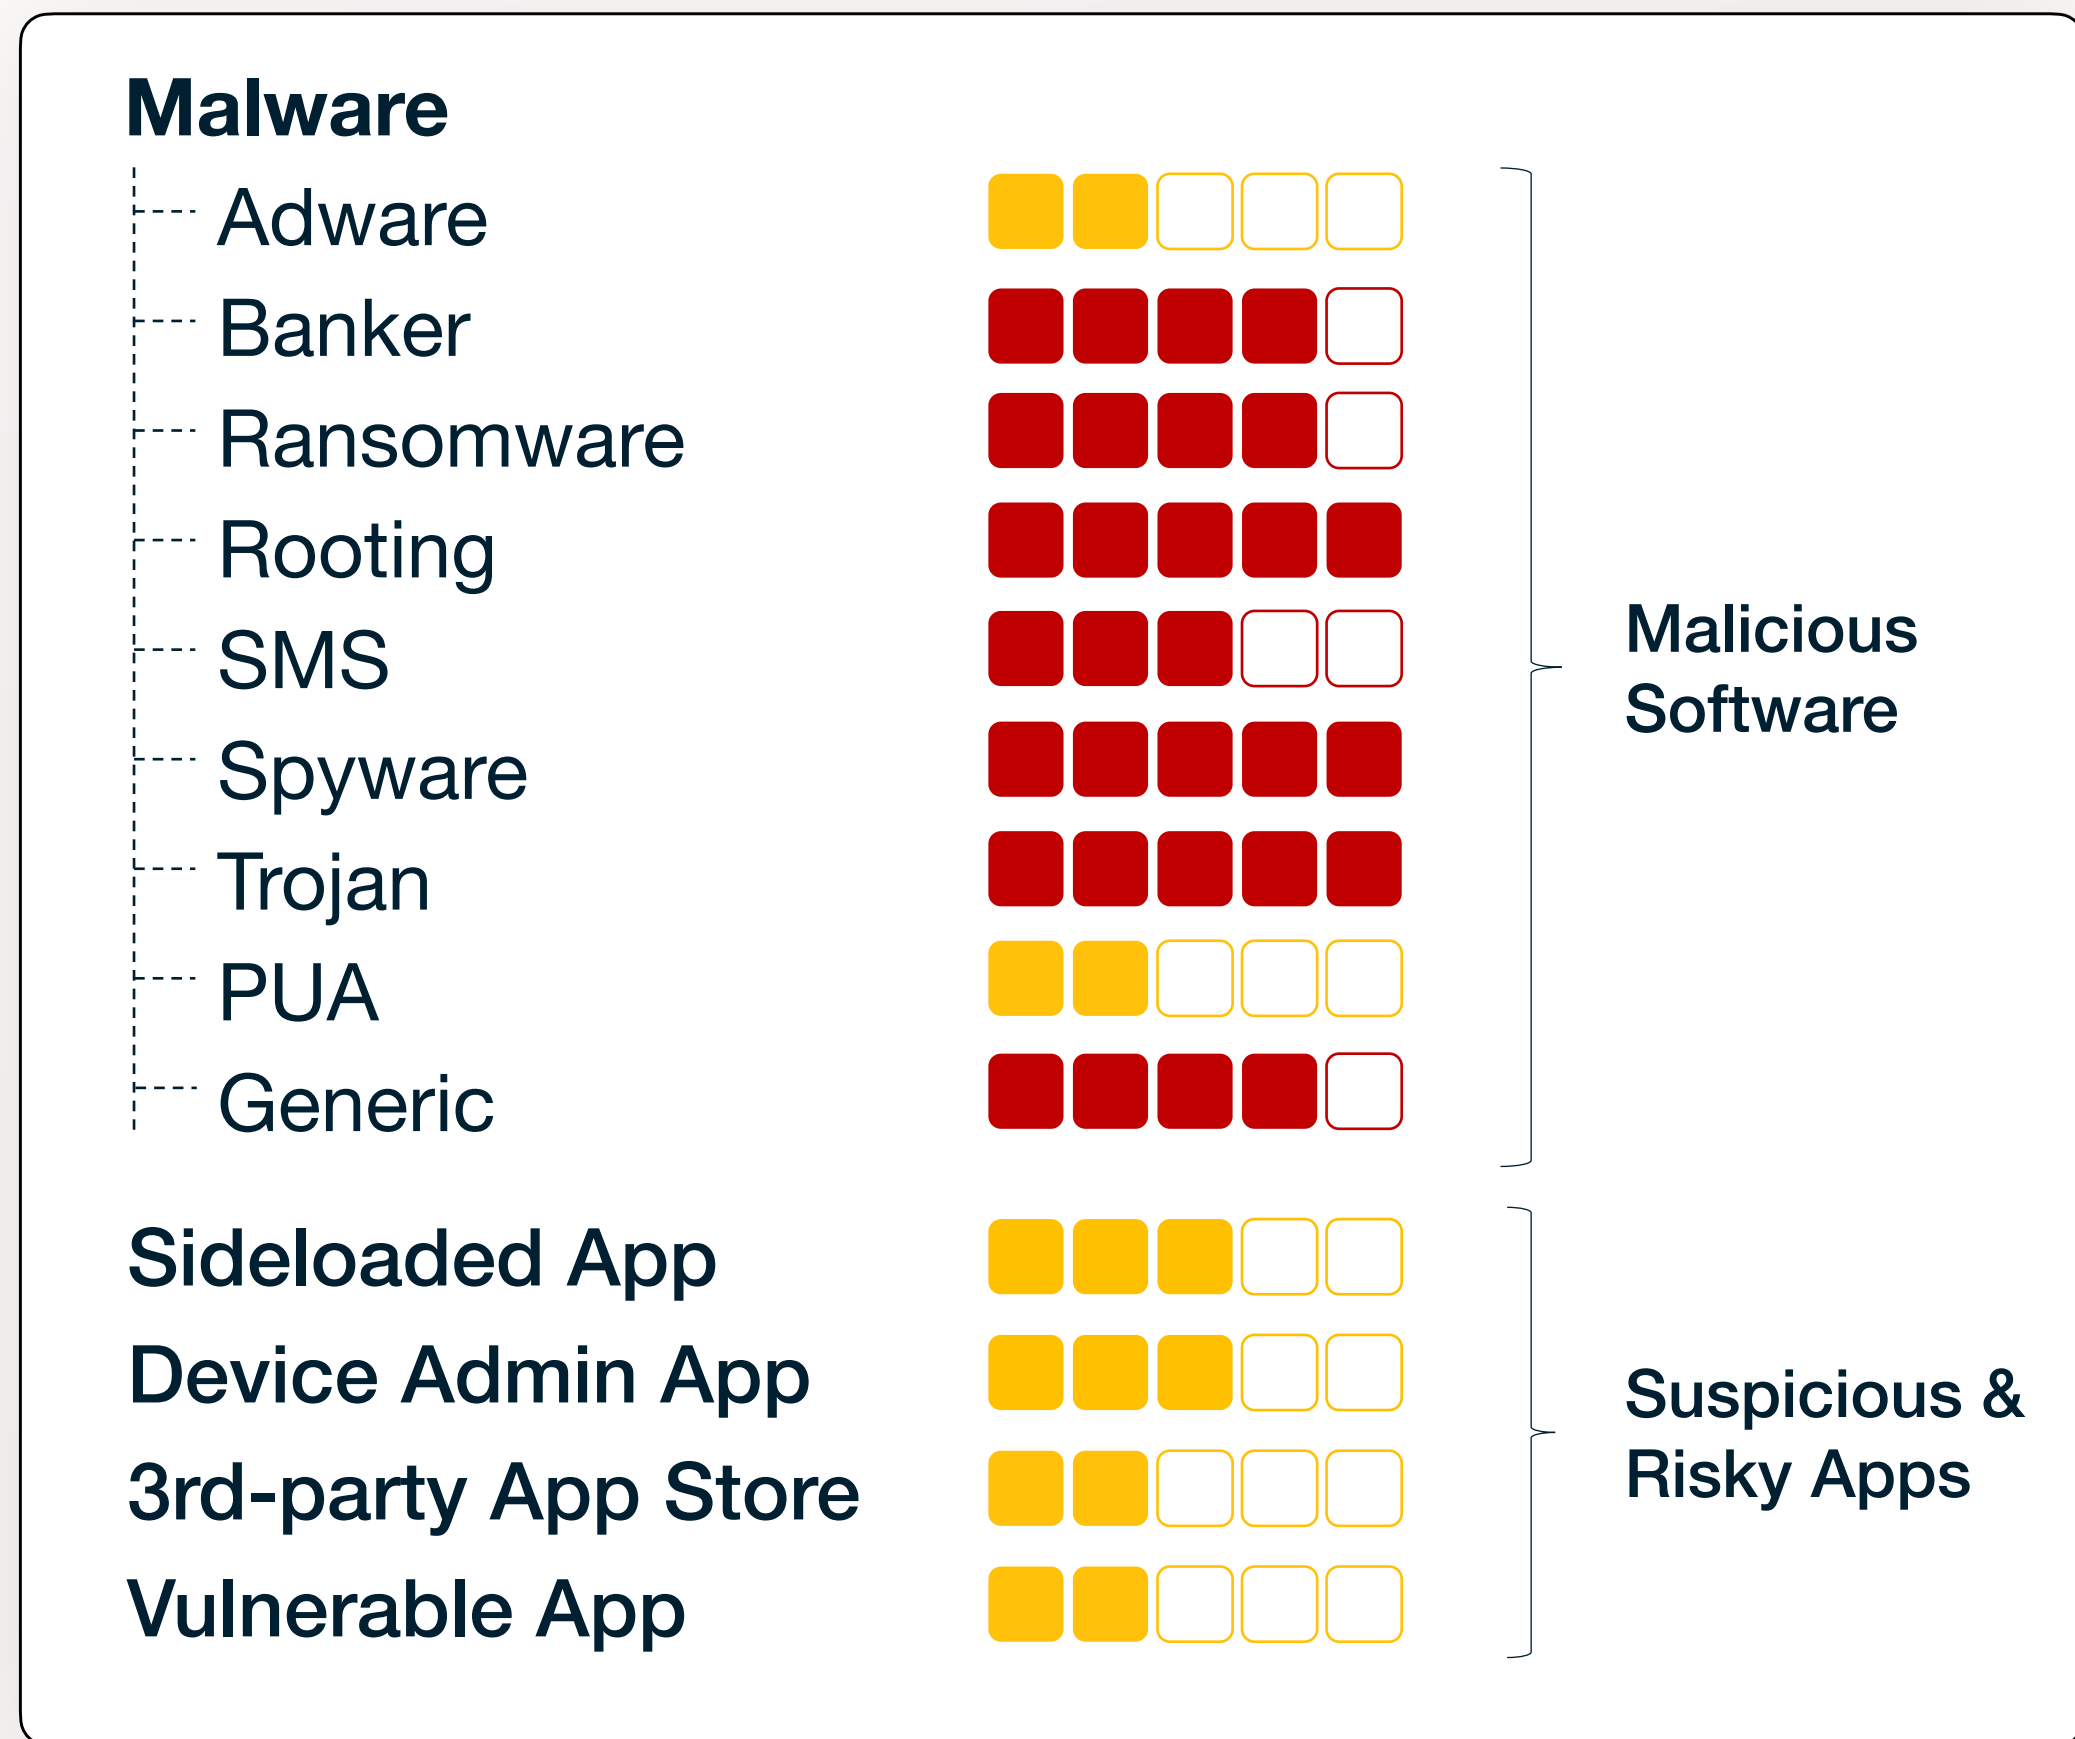

Mobile users face more threats as the enterprise perimeter falls

60% of security professionals think mobile malware is under-reported

Mobile is not risk-free

Mobile users face more threats as the enterprise perimeter falls

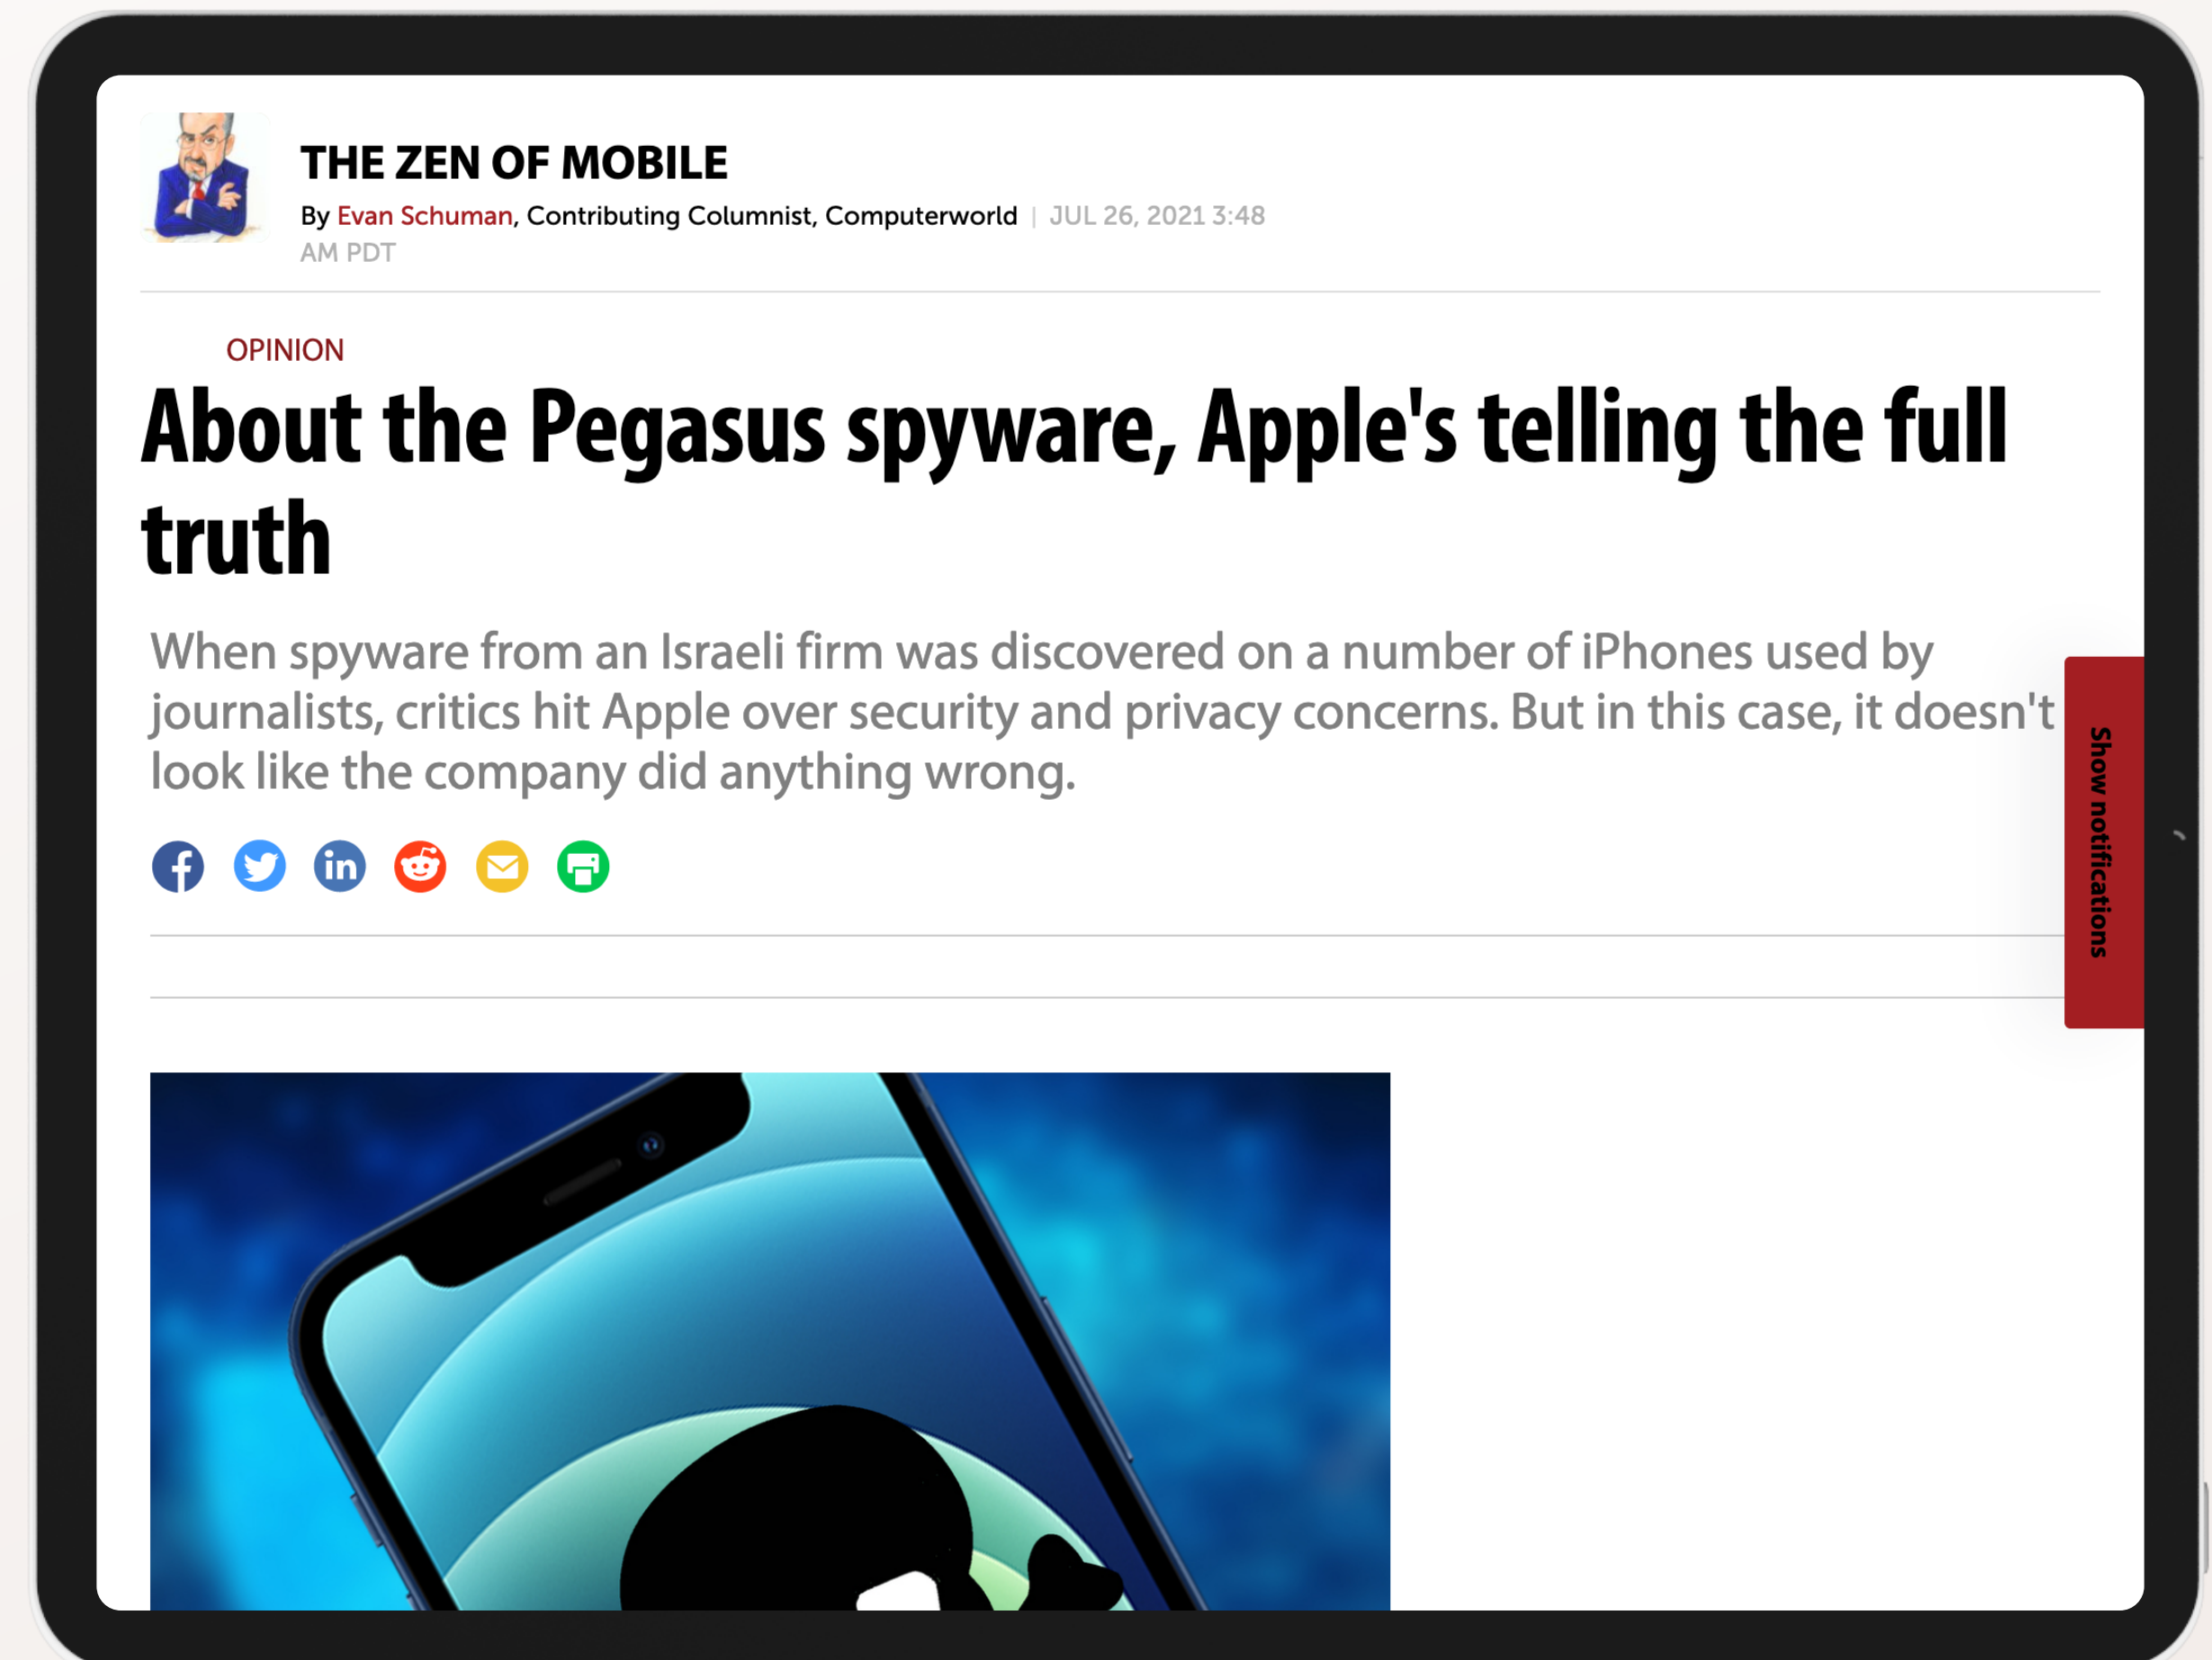

Jamf identifies a broad range of mobile malware categories, each presenting a different risk and impact to the business

‘Always on’ means always vulnerable

Increasing market share and security perceptions make these platforms a target

- Good security hygiene is essential, but bugs do happen and attackers will exploit them
- Targeted attacks are increasingly common, with variations ranging from broad malicious advertising to customizable spyware
- A layered defense is highly recommended for effective protections, even for mobile & hybrid work environments

THE ZEN OF MOBILE

OPINION

About the Pegasus spyware, Apple's telling the full truth

When spyware from an Israeli firm was discovered on a number of iPhones used by journalists, critics hit Apple over security and privacy concerns. But in this case, it doesn't look like the company did anything wrong.

Show notifications

User behavior can open the door to risk

26x

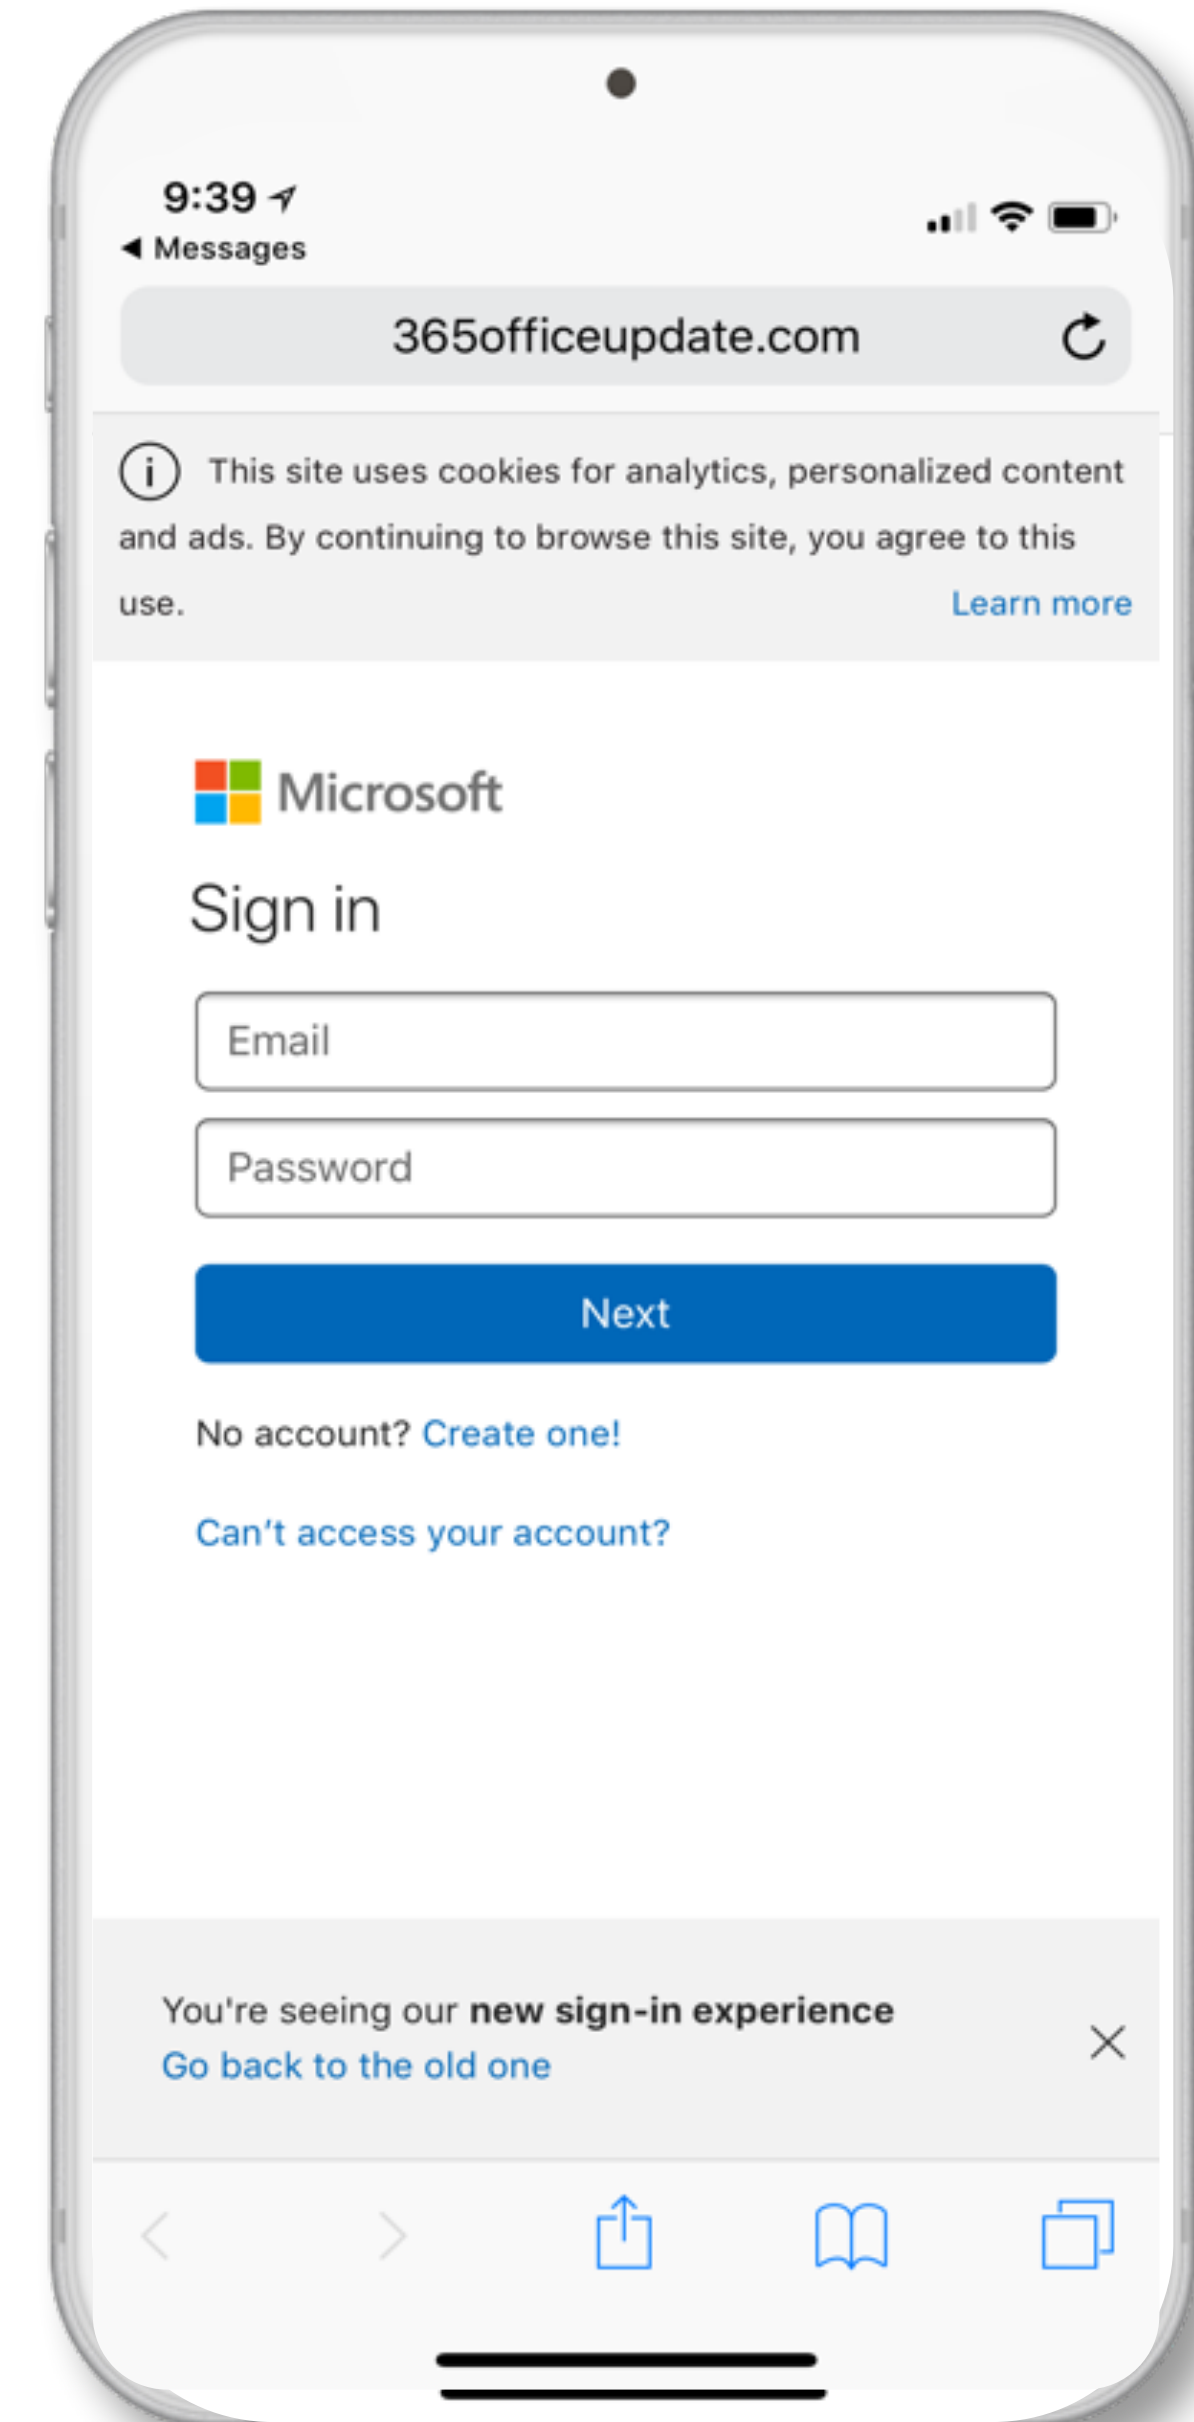

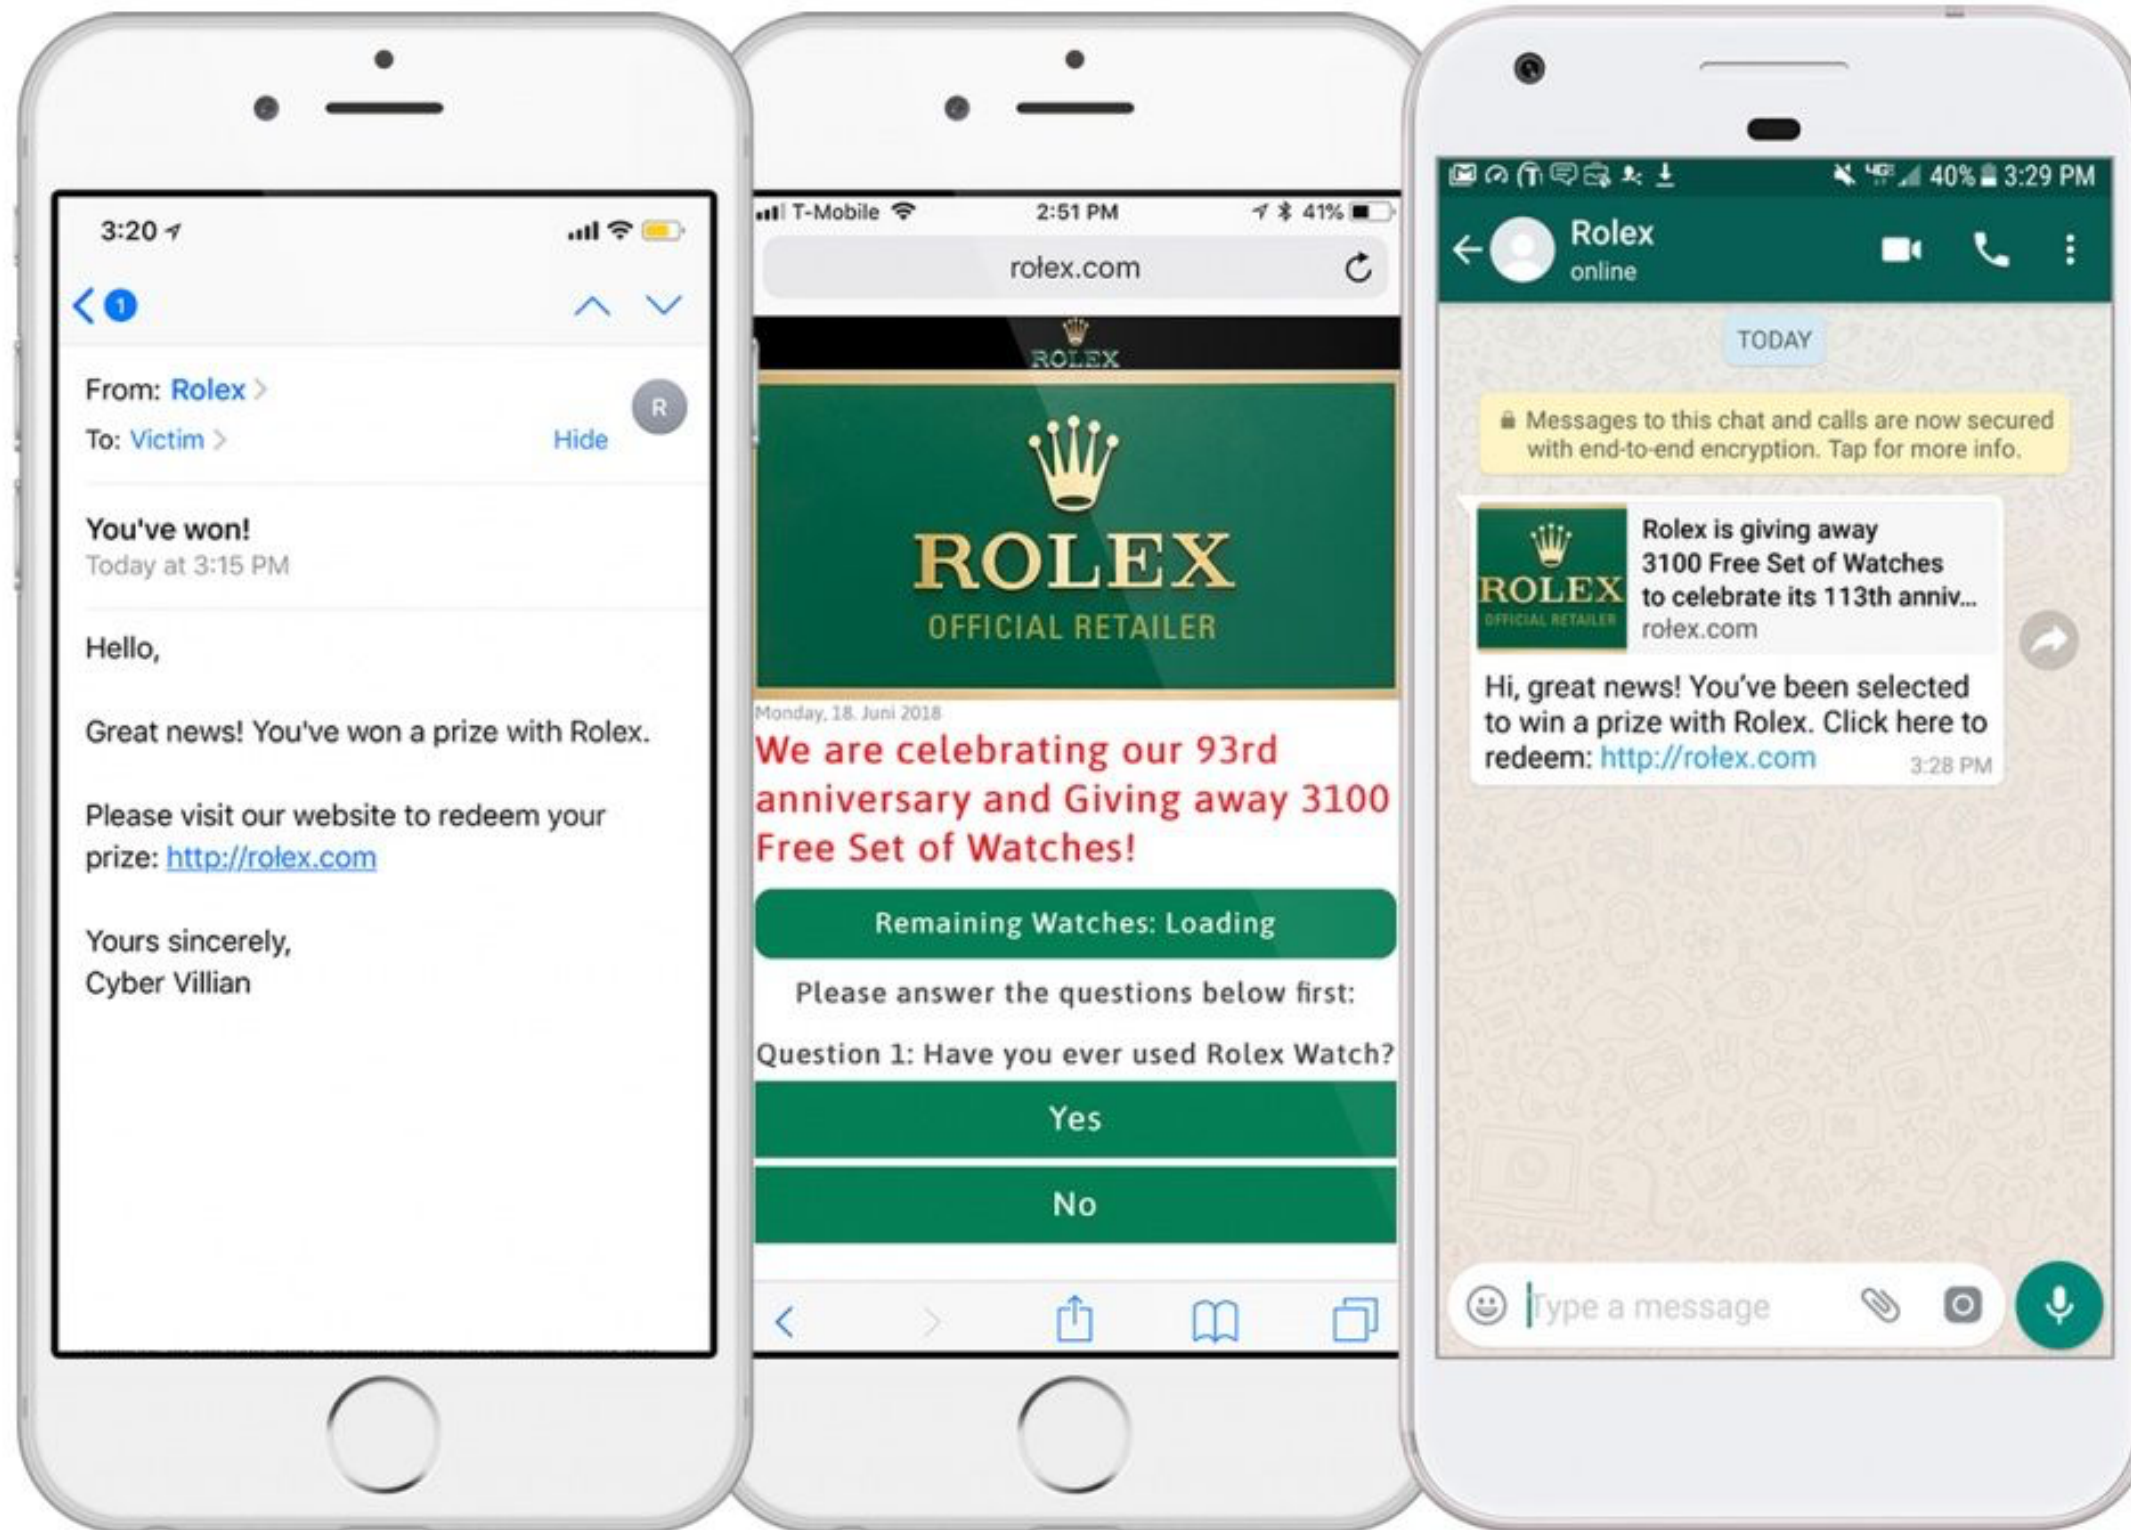

Remote workers were 26x more likely to be phished than to encounter malware

600%

There was a sixfold increase in the number of visits to sites hosting adult content

Phishing is the #1 threat

Corporate credentials are increasingly under attack

User actions can put the organization at risk

Poor decision-making by users can directly introduce risk to the organization

Acceptable Use Policies

Unapproved applications and inappropriate websites put both users and the business at risk

Cellular Usage Controls

Unmanaged mobile data usage can introduce financial risk or result in a loss of service

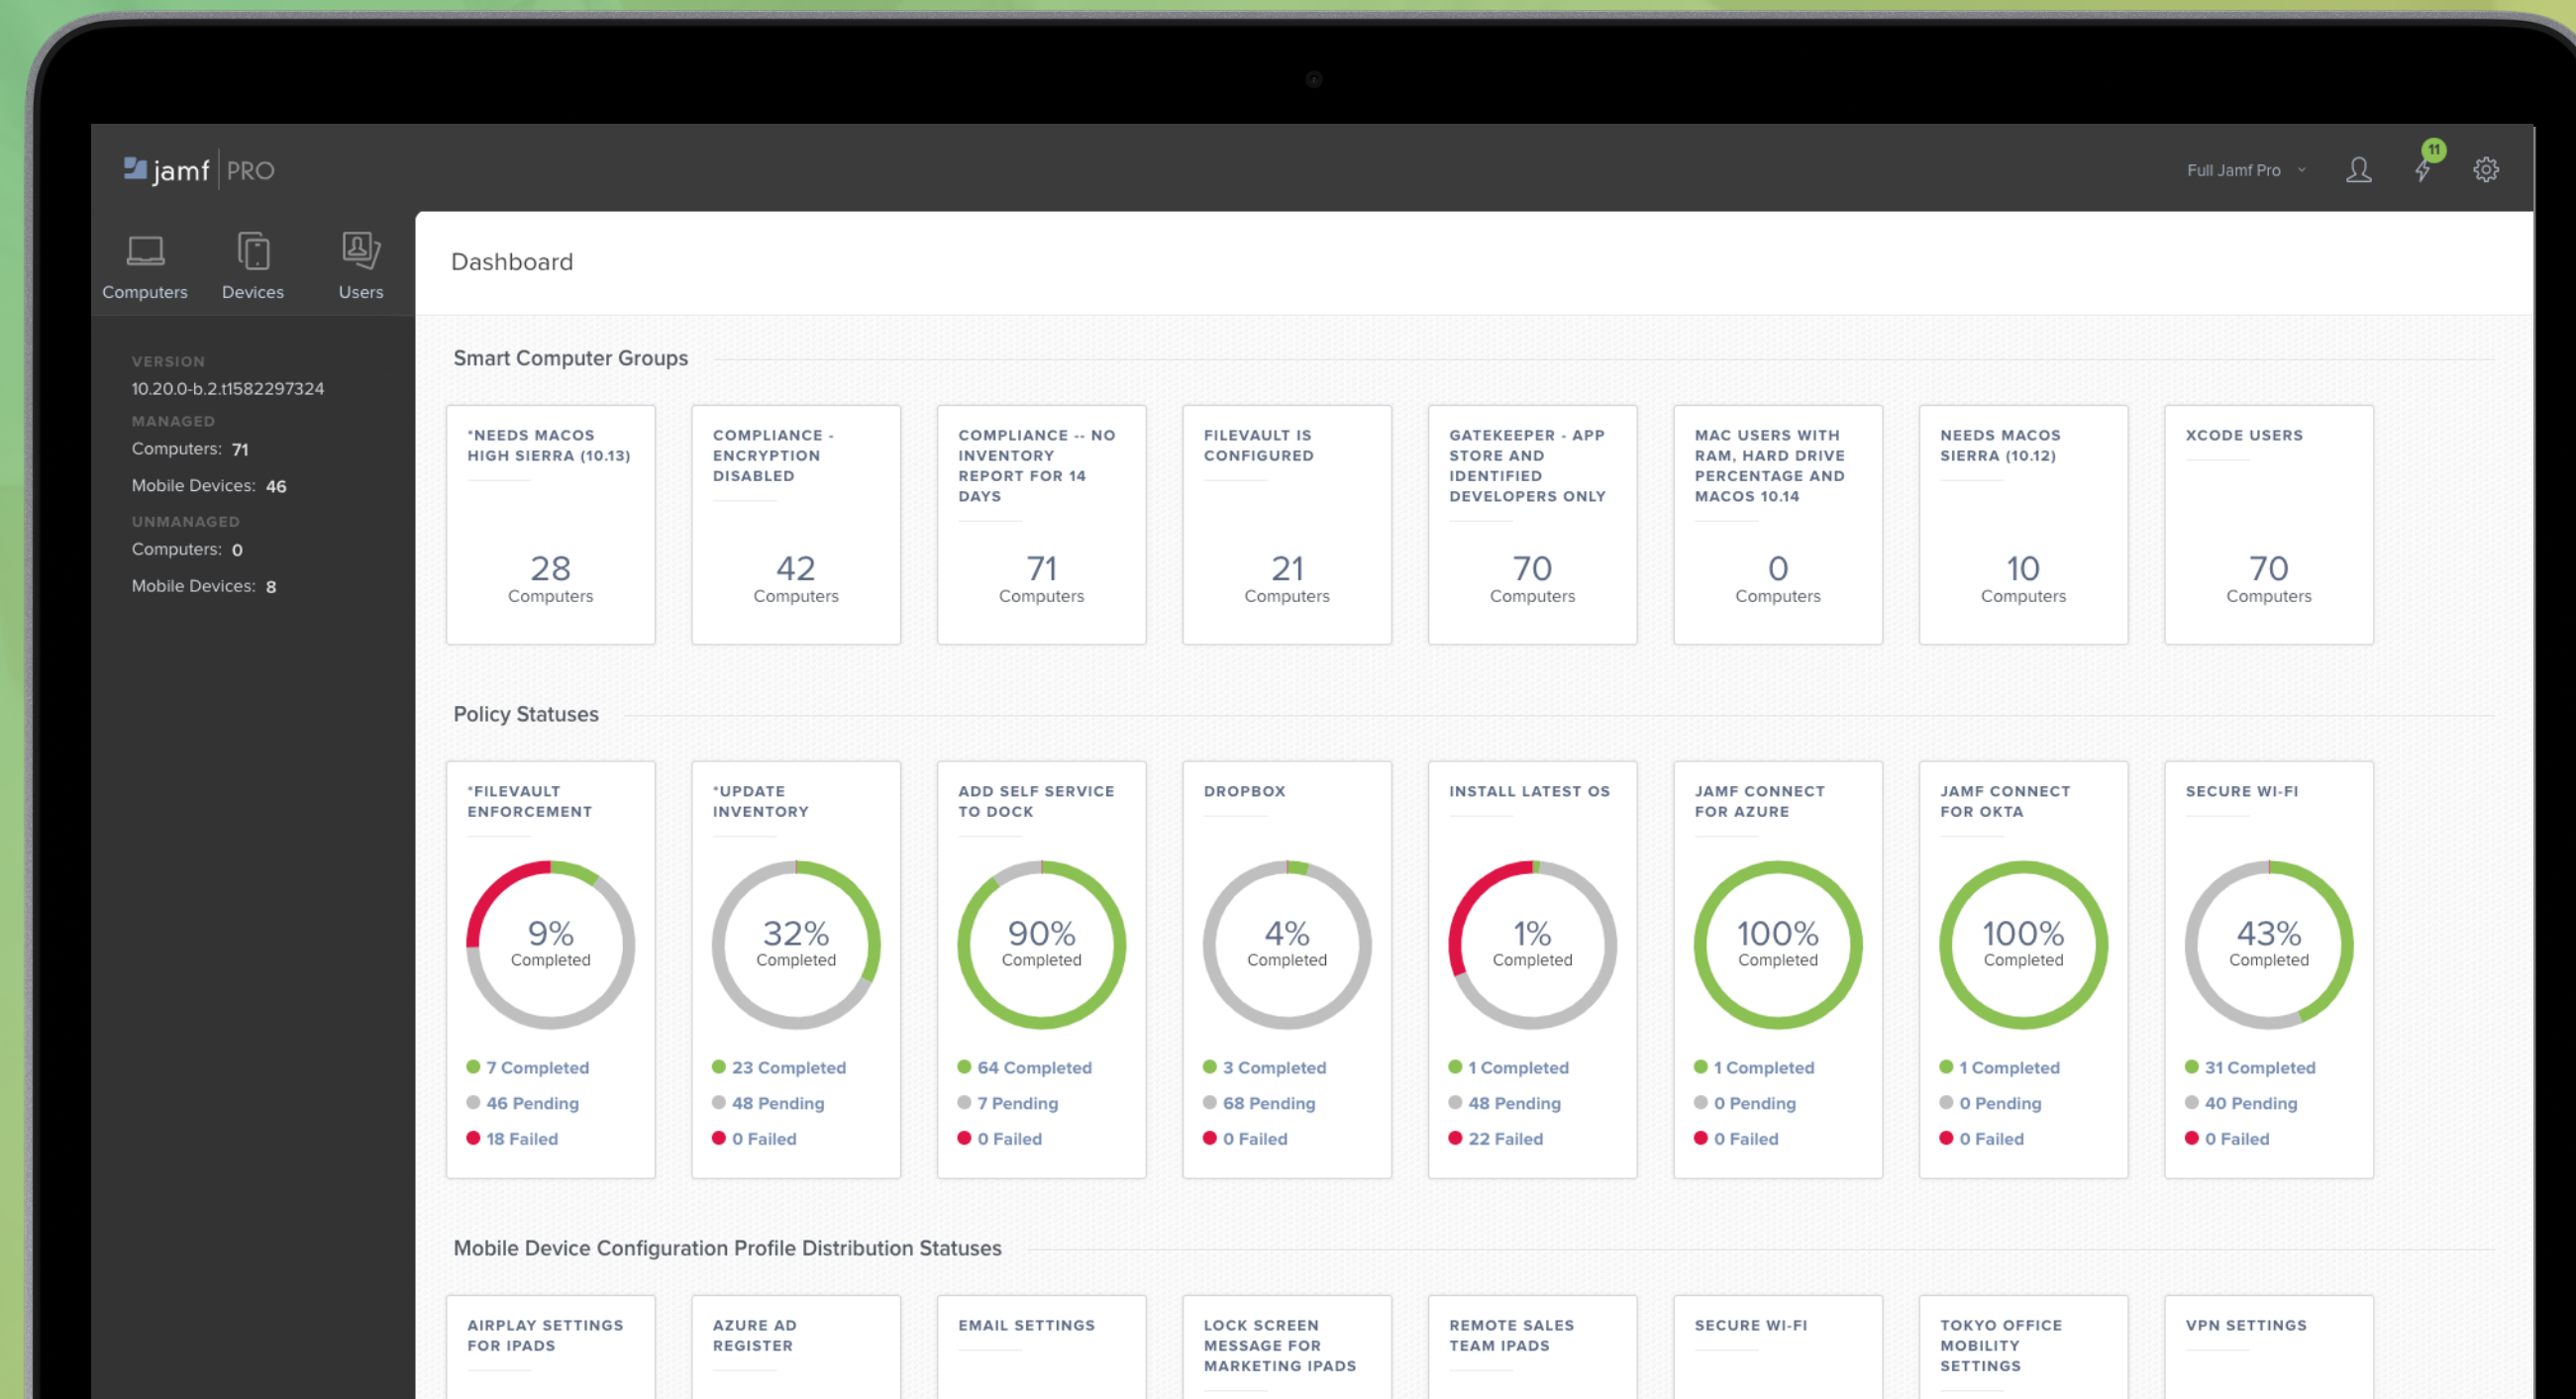

Shadow IT

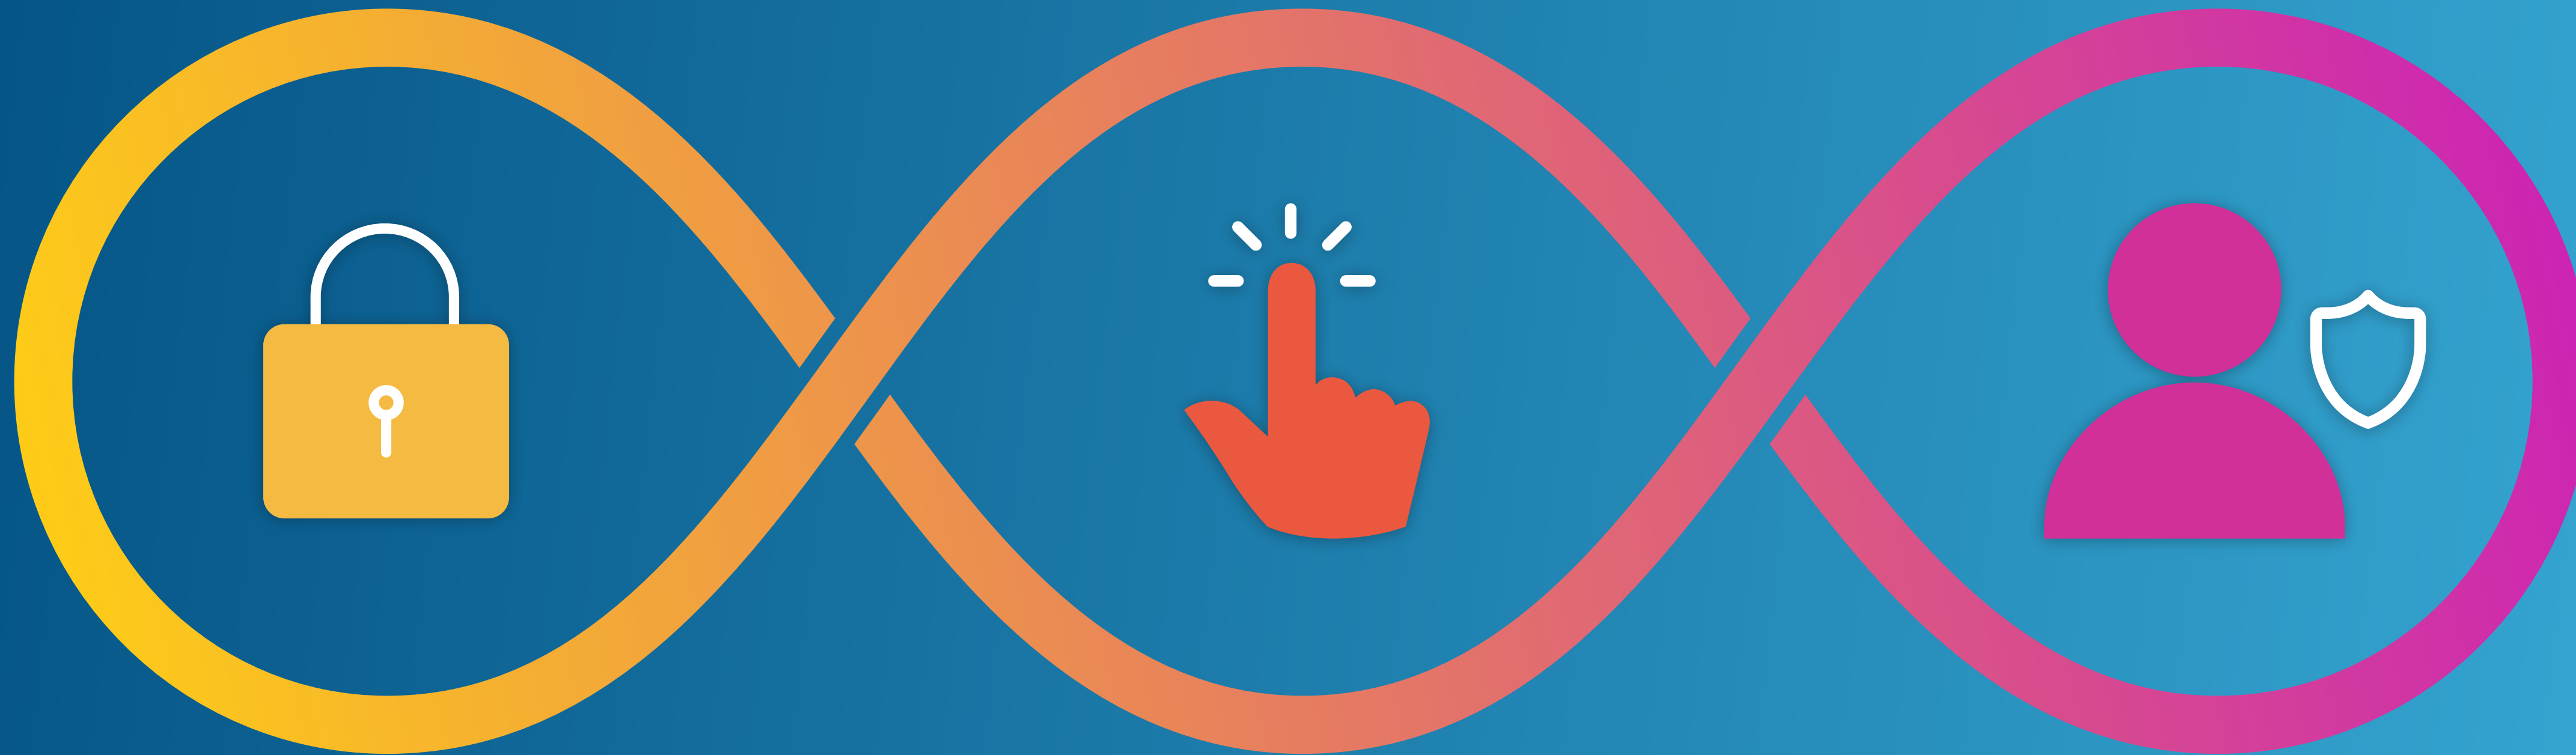

Unsanctioned application use can result in sensitive data being mishandled outside IT control

Empower users with the Apple device they crave

Security and risk management controls should not interfere with the employee experience
