

# Shattering

## the SINGLE PANE OF GLASS Management Model

? How do you manage the various platforms you have in your IT environment?

The reality is, the lack of commonalities across Microsoft, Google and Apple's ecosystems, coupled with the unique and frequent upgrade cycles, means there is no one-size-fits-all approach to device management.

## Here's why you should manage by **ecosystem** instead:

1 Windows, macOS and Chrome OS have little in common.

- All have unique workflows to provision, encrypt, deploy, secure, update and support devices.
- Mobile platforms are in the same boat: iOS, Windows Mobile and Android. Manage devices by ecosystem to optimize management tasks without compromising functional benefits.

2

Keeping up with updates is critical to security and productivity.

Single pane of glass management tools struggle to support multiple and competing maintenance cycles. Support is often delayed by months, quarters, or worse, never supported! Keep users productive and your organization protected with a purpose-built solution that supports updates to an ecosystem's operating systems the day they're available.

3 Supporting new features is most important for the Apple ecosystem.

Apple users are quick to upgrade to the latest features.

Why?

The upgrade process is simple and they want to take advantage of the latest capabilities.

Users on the latest operating system

PROOF

4 Industry research indicates that the single pane of glass model doesn't work.

In fact,

82%

82% of organizations use two or more enterprise mobility management solutions

5

Centralize with purpose-built service providers.

Tools for identity management, directory services or network access should connect the dots (instead of hoping a single pane of glass tool can do it all). Use an **integration-friendly ecosystem management solution** to connect existing IT services and get the most from your platforms while supporting your broader IT strategy.

## Don't know where to begin?

Apple's ecosystem shares the most management commonalities across its operating systems - macOS, iOS and tvOS. The "seamlessness" of the Apple ecosystem creates an incredible user experience that also caters to IT in an enterprise setting.

Jamf is the tool trusted by those who trust Apple.

As the standard in Apple device management, Jamf makes it easy for you and your organization by offering a simplified cost structure, one contract for all your Apple device management needs, one upgrade schedule and one number to call for expert Apple advice.
