# Innovating technology for mobile-first workers

Simplify work for deskless workers with better technology.

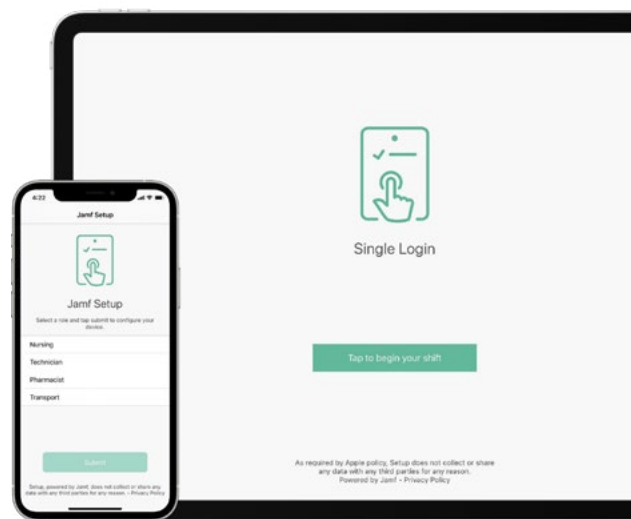

One distinct reason technology is deployed at work is to enable devices of purpose, such as those that serve as a point of sale (POS) in retail or as a clinical communications tool in healthcare.

Organizations are innovating with mobile technologies, dramatically changing many environments as these devices are incorporated into workflows. The goal is to provide tools that help workers access information faster, perform tasks more efficiently, and seamlessly interact with line of business applications.

Mobile devices are often the only work platform for workers who don't sit behind a desk – the "deskless" workforce. These devices must be optimized to help workers achieve their objectives in the most efficient manner.  The 'deskless' environment also faces unique challenges, like "hiding" the technology so workers can rapidly connect to the task-oriented tools they need, while reducing the technology strain on the end user.

However, organizations can struggle to enable these roles with tools that streamline their work. And these employees often feel unsupported in the tech they use.

**Better connect workers to their work**
Mobile devices available today are designed with consumers in mind. But organizations need technologies that extend those devices to the enterprise that reduce IT complexity, automate redundant processes and simplify workflows to create a more productive workforce.

**Jamf makes this possible.**
Manage and secure Apple for your deskless workforce to extend what's possible for purpose-built work tools. We provide solutions to offer workers using iPhone and iPad in mobile-first, task-based roles for simple, secure and customized experiences.

**More than 60% of deskless workers** report a lack of satisfaction or feel the need for improvement in the tech they use.

McKinsey & Company Technology Trends Outlook 2022

# Jamf enables devices for specific purposes by making them easily deployed, secured and ready to connect to organizations' business tools and resources.

## Manage

Automate and scale device and application management to ensure work devices are always available and appropriately configured.

## Secure

Establish and maintain secure settings and incorporate identity into workflows to accelerate access to critical business information and enforce zero trust security policies.

## Extend

Use Jamf's API framework to integrate into existing platforms and workflows or **the Jamf Marketplace** to extend the power of Jamf with pre-built solutions and better connect your employees to their work.

## Shared-device support

A one-size-fits-all device leaves distractions and unnecessary apps on the device. An overly restrictive device doesn't allow flexibility to get work done. **Provide the perfect mix of apps** for a tailored experience with pre-built, role-specific configurations.

## Role-based provisioning

Configure devices specifically for the role, without touching the device. Teams can locate, manage and secure devices throughout their lifespans. Customize the home screen so users immediately understand the state of the device.

## Meet compliance and security standards

Establish secure baselines, leverage workflows to verify device compliance and protect devices from sophisticated threats, while aligning to organizational standards or regulatory compliance frameworks, such as CIS benchmarks, PCI DSS or HIPAA.

## Industry and technical experts

Jamf's dedicated industry and technical teams work with your organization to provide wide-ranging expertise and resources to help your organization find the solution that best fits your needs.
