

Apple Security in the Construction Industry

Technology to build smarter from start to finish

In a trillion-dollar industry where deadlines run tight and margins slim, communication and efficiency are the difference between making money or losing a job to a competitor. Over the last year, the face of the construction jobsite has changed as more people onsite stay in touch through mobile devices. Often these devices are company issued with apps and tools needed for agile project completion.

However, the introduction of — and investment in — technology does not come without challenges. Companies need methods to ensure physical devices and the company/client data on them remain protected. Leveraging the power of native Apple device security with the added security benefits of Jamf Now help you deploy the correct apps and tools to the right device and brings increased protection no matter where devices are being used.

Construction security features needed

REMOTE LOCK OR WIPE

Disable the device until the passcode is applied or remotely wipe the data.

LOST MODE

Show a lock screen message, disable device and show its location.

SECURE APP DEPLOYMENT

Securely deploy apps from a central location to individuals or teams.

OPERATING SYSTEM UPDATES

Update a single or all devices to ensure they are up to date and secure.

DEVICE ENCRYPTION

Enforce enterprise-level encryption to protect data and store recovery keys.

Any of this sound familiar?

When it comes to security, every business case is different. Finding what works best for your organization should be a combination of best practices and a plan that fits your needs and device usage.

Problem

Lost or damaged devices

Inconsistent apps and software

Out of date devices

Data protection

Jamf Now solution

Hectic jobsites and shift changes lead to missing devices. Turn on Lost Mode, Remote Lock or Wipe to locate the device, put in a locked state (until a password is entered) or completely wipe the device to ensure no company data is in danger.

Make sure each device is uniform with the apps and software needed to get the job done with secure app deployments. Efficiently deploy all apps using Jamf Now instead of one by one so your team can focus on the task at hand.

Out of date devices are a security threat that is easily avoided with Jamf Now. Ensure every device is on the most recent operating system by pushing updates to them from a central location — regardless of what jobsite the device is on.

Data encryption is key to preventing prying eyes from seeing company communications and client data on a device. Getting data encrypted is as simple as enabling FileVault on a Mac or enforcing a passcode on an iPad with Jamf Now.
