# Employee Badge
with **Jamf Trust**

powered by SwiftConnect

Modernize your physical access infrastructure with a cloud-connected solution, providing quick and easy access to physical spaces without the need for physical keys or cards.

Allowing only trusted users on trusted devices, Employee Badge brings Trusted Access into office spaces, elevates the employee experience and enables multiple layers of security by attaching the user's cloud identity to the device.

Contactless access control

Grant access to office spaces via mobile devices, replacing physical employee badge access cards with a digital pass in mobile wallets. As a flexible workplace cloud service, it enables offices to be accessed on-demand, in real time and operated as a network, making your office space management dynamic and agile.

Manage access programmatically

Employee Badge with Jamf Trust enables a physical-logical connected access experience, creating a flexible and responsive workplace. Directories, space management systems, mobile device management (MDM) tools and other upstream sources and applications can grant or revoke access permissions for employees and tenants.

Embrace a modern, secure workplace

Physical keycards are a security vulnerability, changing hands frequently and being prone to misplacement or loss. Strengthen the physical security of your office building and provide contactless access control to office spaces that requires multifactor authentication (MFA) to provision, and verified passcode or biometric access for Apple Wallet to work.
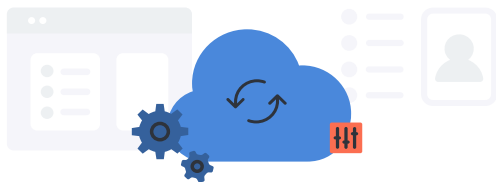

Power hybrid work

Embrace hybrid work by providing a scalable infrastructure for employees to access office spaces through centralized office management. Whether it's access to the parking garage, front door or interior controlled doors, use employee cloud identities to automate access control.

Integrates with existing access control and space management systems

Consolidate fragmented systems into a single cloud-enabled network, allowing use of a single set of credentials to access any location or space. Leave your existing access control system software and hardware including card readers in place and reduce the cost of buying and replacing RFID cards.

Control and safety

You can configure Access Controls within Jamf Security Cloud and deploy the digital badge to workers via the Jamf Trust end-user app, supporting both company-owned and BYOD devices. When an employee device is marked as lost, this turns off access to Apple Wallet and temporarily suspends cards and passes, including employee badges.

Safe onboarding and offboarding

Manage employee office access like you manage software and build it in as part of the onboarding and offboarding process. You can grant or remove office access instantly regardless of location.
